

Collaborative Information Processing (CIP) in Sensor Networks

Presentation at pHealth 2009 Workshop Session
“Personal Portable Devices and Sensor Networks”
26 June, 2009, Oslo, Norway

Qiang Pan (qpan@mail.sim.ac.cn)

Shanghai Institute of Microsystem and Information
Technology (SIMIT)

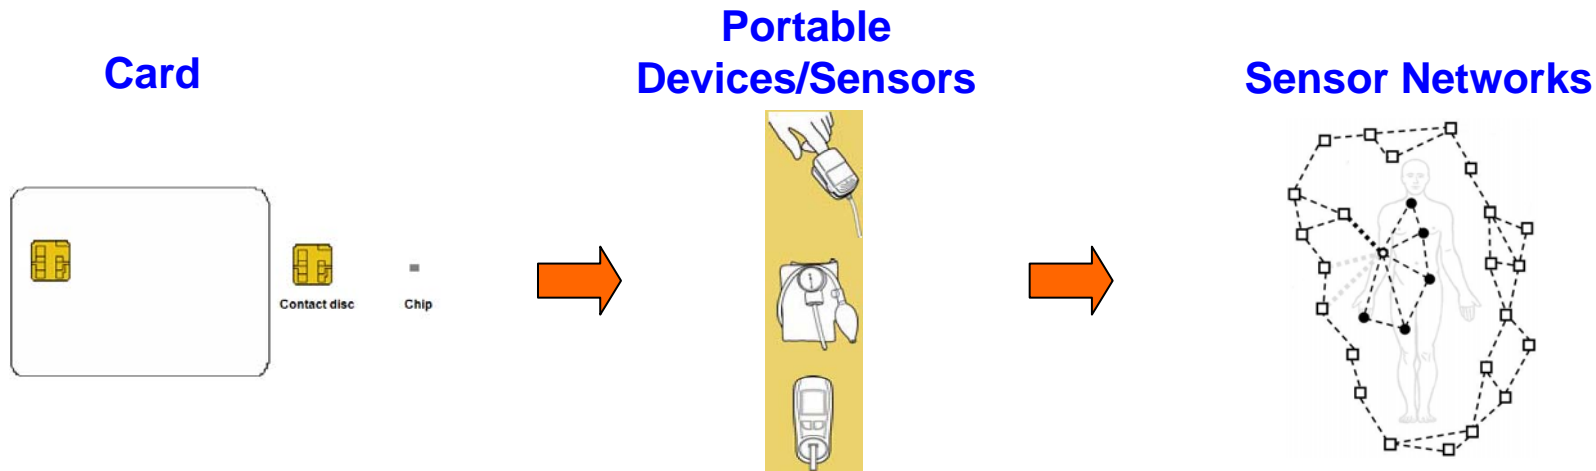

Chinese Academy of Sciences (CAS)

Outline

- Sensor network application 1 (eHealth)
- Sensor network application 2 (anti-intrusion system)
- Information processing requirement analysis in applications
- CIP overview in sensor networks
- CIP model in sensor networks
- Key issues on CIP in sensor networks
- Generic CIP implementation framework in sensor networks
- Further issues on CIP in sensor networks
- Conclusion

Sensor Network Application (eHealth)

Physical Entities

Data Features

- Identification
- Medical record
- Administrative data

- Blood pressure
- Body temperature
- ECG
- ...

- Fitness evaluation
- Disease management
- Danger alarming

- **Artificial**
- **Man-made**
- **“abstract”**

- **Physical**
- **independent**
- **respective**
- **“real”**

- **Aggregated**
- **Fused/Post-processed**
- **Personalized**
- **decisive**

Sensor Network Application (anti-intrusion system)

- Different intruders
 - Person
 - Heavy wheeled vehicle
 - Light wheeled vehicle
 - Animals, ...
- Different intrusion behaviors
 - Object casting
 - Fence destroying
 - Climbing
 - Underground intrusion, ...

Information Processing Requirement Analysis in Applications

- Vital sign monitoring
- Basic life monitoring
- Trend analysis and alerting
 - Reliable event detection
 - Long time periodic monitoring
 - Adaptive processing
 - Pervasive monitoring
 - High-level information fusion
 - Personalized service providing
 - Context-aware Sensing
- Intruder detection
- Intruder classification
- Intruder localization & tracking
 - Extremely low false negative rate
 - Low false alarming rate (FAR)
 - Low time latency
 - Correct object classification
 - Low localization error
 - Maneuvering object tracking
 - Performance stability

CIP Overview in Sensor Networks (1)

- Why we concern on collaborative information processing?
 - **Measurement is NOT the ultimate goal of sensor networks.**
 - The aim of sensor networks is to obtain information or knowledge from the physical world.
 - Information or knowledge can be extracted from sensor measurements.
 - Information processing translates sensor measurements into knowledge.
 - **Sensor network is NOT “Sensor + Network”.**
 - Raw sensor measurement is just a straightforward kind of payloads.
 - In-network processing is implemented along with data communication.
 - **Information processing should NOT be applied only in a centralized manner.**
 - High efficiency using distributed processing
 - Progressive accuracy requirement
 - **Information processing can NOT be fully covered by application layer.**
 - Dynamic node clustering/grouping along target trajectory
 - Dynamic node activation on event occurrence
 - Adaptation on sensing and communication capabilities

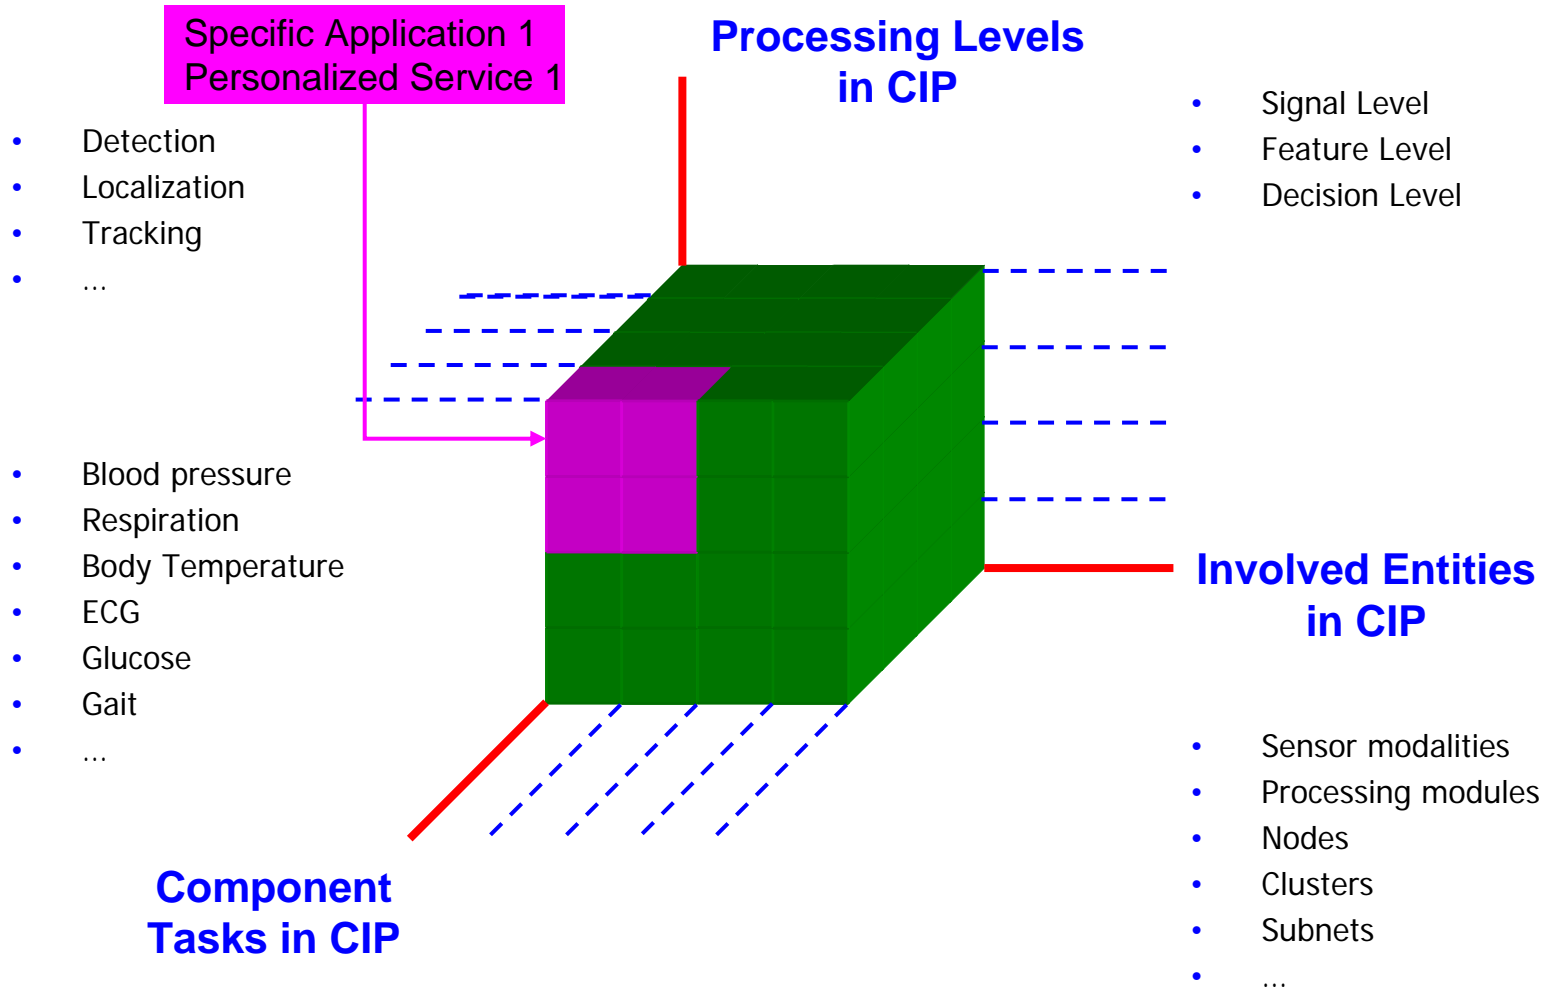

CIP Overview in Sensor Networks (2)

- CIP is an essential solution for **challenges** in sensor networks.
 - **Constrained resources**
 - Energy, communication bandwidth, computing, storage, size, cost, etc.
 - **High information sensing performance requirements**
 - Reliable target detection
 - Correct target classification
 - Accurate and fast target tracking etc.
 - **Integrated service providing**
 - Situation evaluation and prediction etc.
 - **Complicated application scenario & environment**
 - Random noise
 - Uncertain interference
 - Erroneous/unstable wireless link
 - Incorrect/inconsistent/incomplete sensor measurement

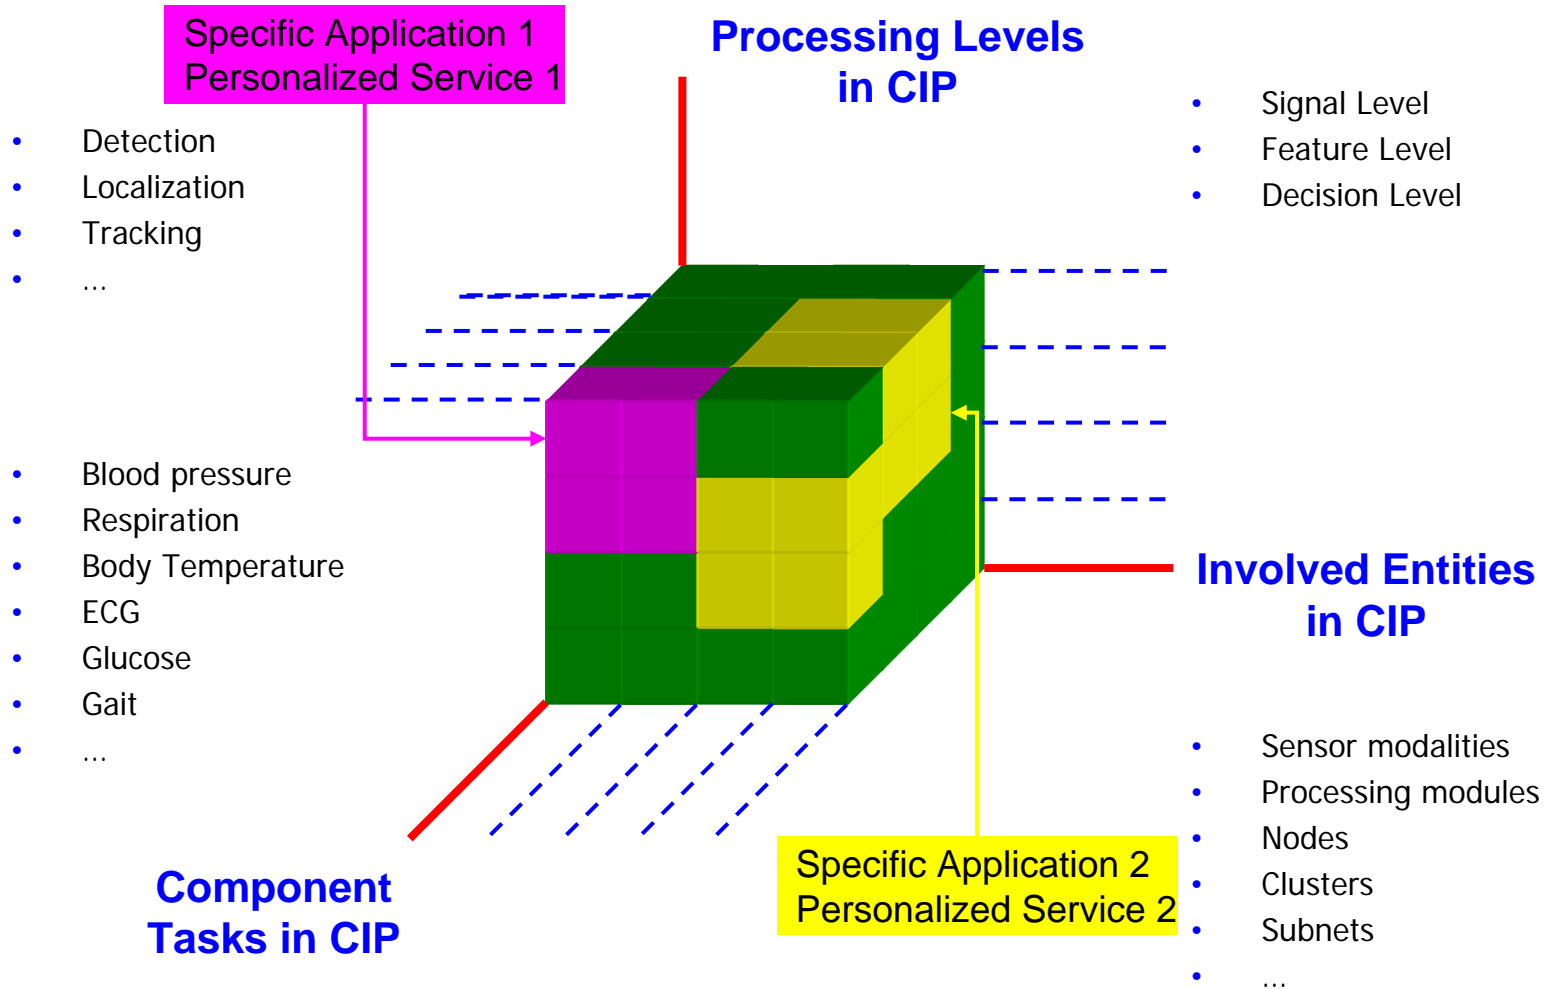

CIP Model in Sensor Networks (1)

CIP Model in Sensor Networks (2)

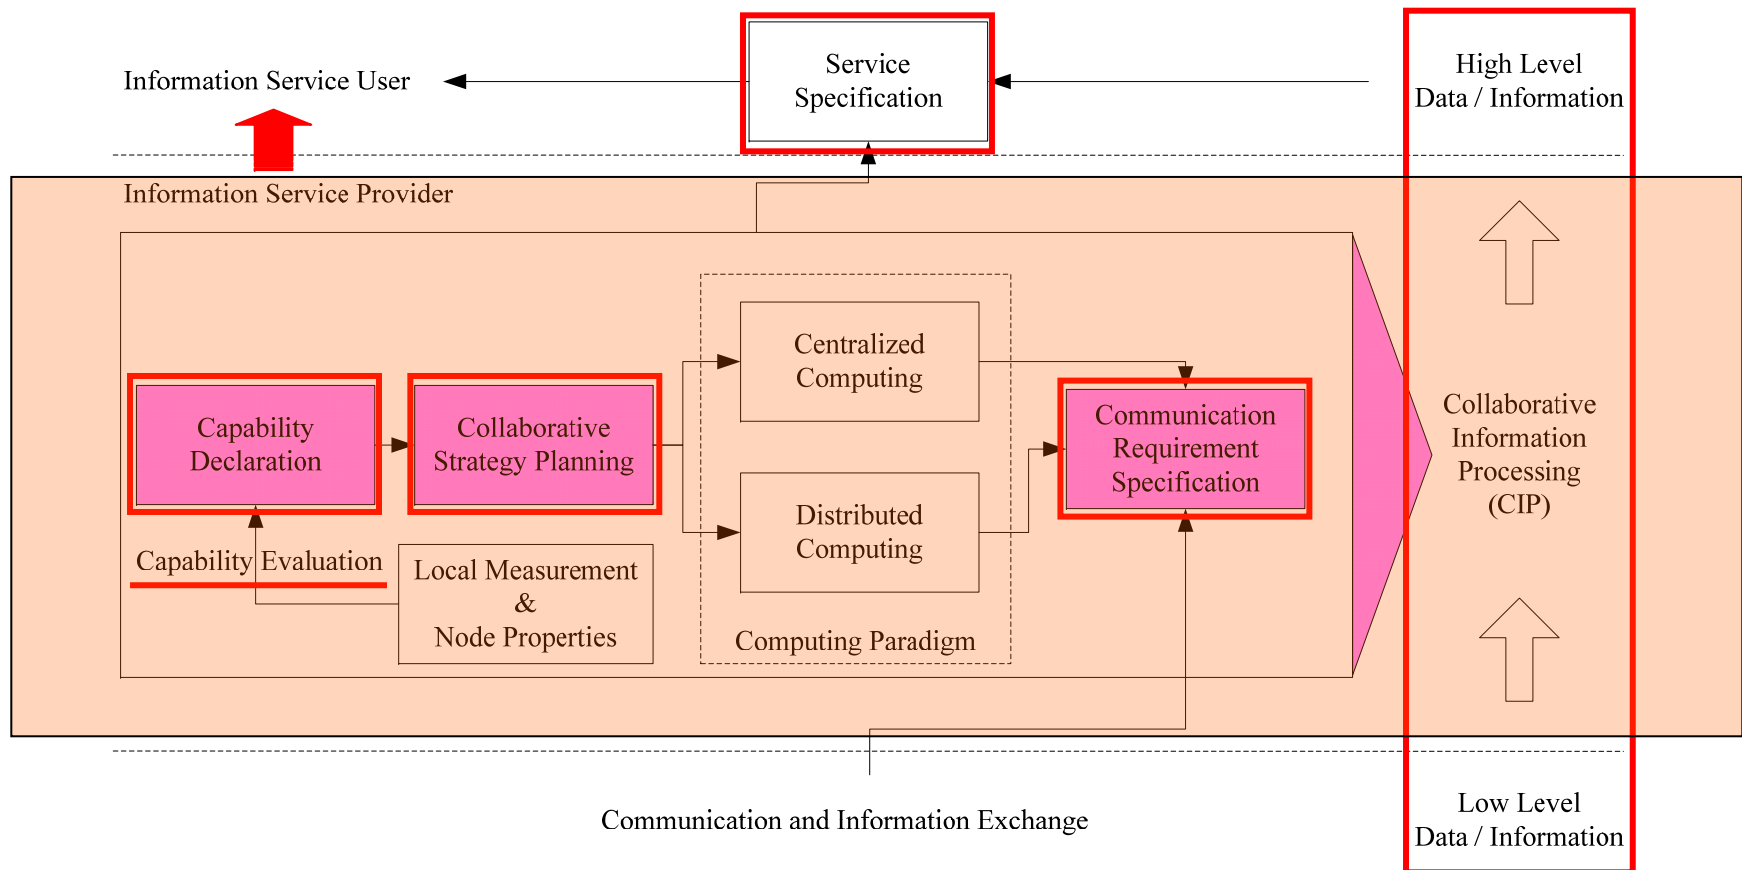

CIP Model in Sensor Networks (3)

Key Issues on CIP in Sensor Networks

- **Question 1: What** is the CIP objective?
 - Service description and Service-to-task mapping
 - Quality of Services (QoS)
- **Question 2: Who** should participate in CIP?
 - Potential participants:
 - sensor modalities, algorithm modules, nodes, clusters, subnets, ...
 - Capability evaluation:
 - Networking perspective: power, transmission range, bandwidth, ...
 - Sensing perspective: sensing range, SNR, information gain, ...
- **Question 3: What** is the rules in CIP?
 - Strategy planning algorithms
 - Active/Sleep mechanism, dynamic networking, message exchanges, ...
 - information utility functions
- **Question 4: How** should CIP be implemented?
 - Centralized or distributed computing
 - Leader selection, Mobile agent computing
 - Communication requirements
 - Priority communication, Secure communication, multicasting, ...

Generic CIP Implementation Framework in Sensor Networks

Further Issues on CIP in Sensor Networks

- Environment-adaptive CIP
 - Environmental feature extraction
 - noise and interference characterization
- Coupling between autonomous networking and collaborative sensing
 - coupling principle
 - association methods
 - handshake mechanism
- Dynamic service and task mapping
 - Subtask assignment
 - Role transferring
- Data flow models in CIP
 - Data flow classification
 - Semantics, syntax and timing in data exchange

Conclusion

- CIP should be carefully designed to meet challenges in sensor networks from both the networking and the information sensing perspectives.
- The implementation of CIP in sensor networks involves considerations from different information processing levels, different entities and different component tasks.
- CIP closely relates networking with sensing in sensor networks.
 - For purpose of system efficiency, sensing method, network topology, node state and data transmission mechanisms etc. may be dynamically changed.
- CIP is an integral part in sensor network standardization.
 - A subgroup on CIP (PG4) has been established under the standardization working group on sensor network (WGSN) in China.

Q&A
Thank you!
