

# Biofouling of cultivated *Saccharina latissima*

- local, latitudinal and time dependent variation

Sanna Matsson, Akvaplan-Niva, UiT The Arctic University of Norway

SIG Seaweed Trondheim 27.11.2019

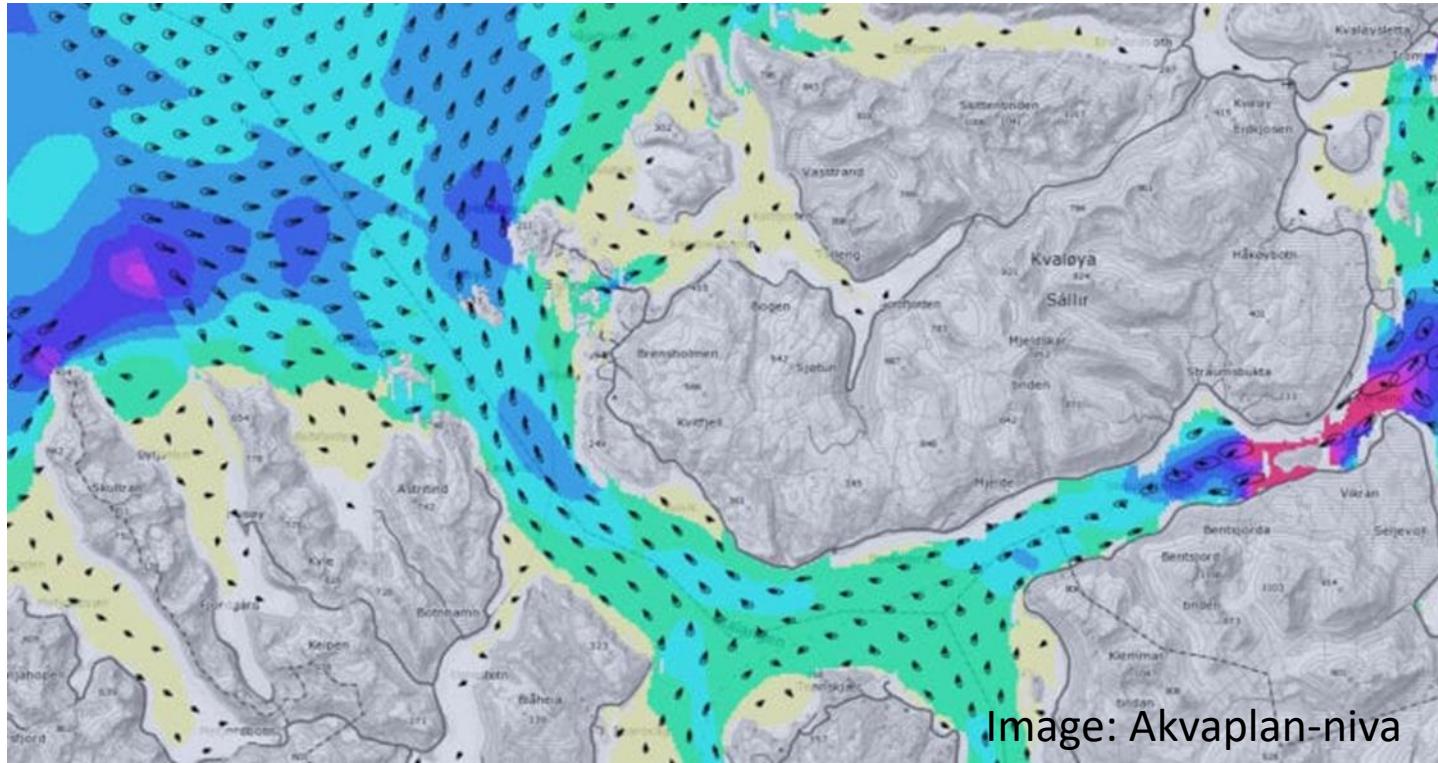

Quality of biomass

Biomass yield

# Map Predict

# Local variation

MACROSEA

# Latitudinal variation

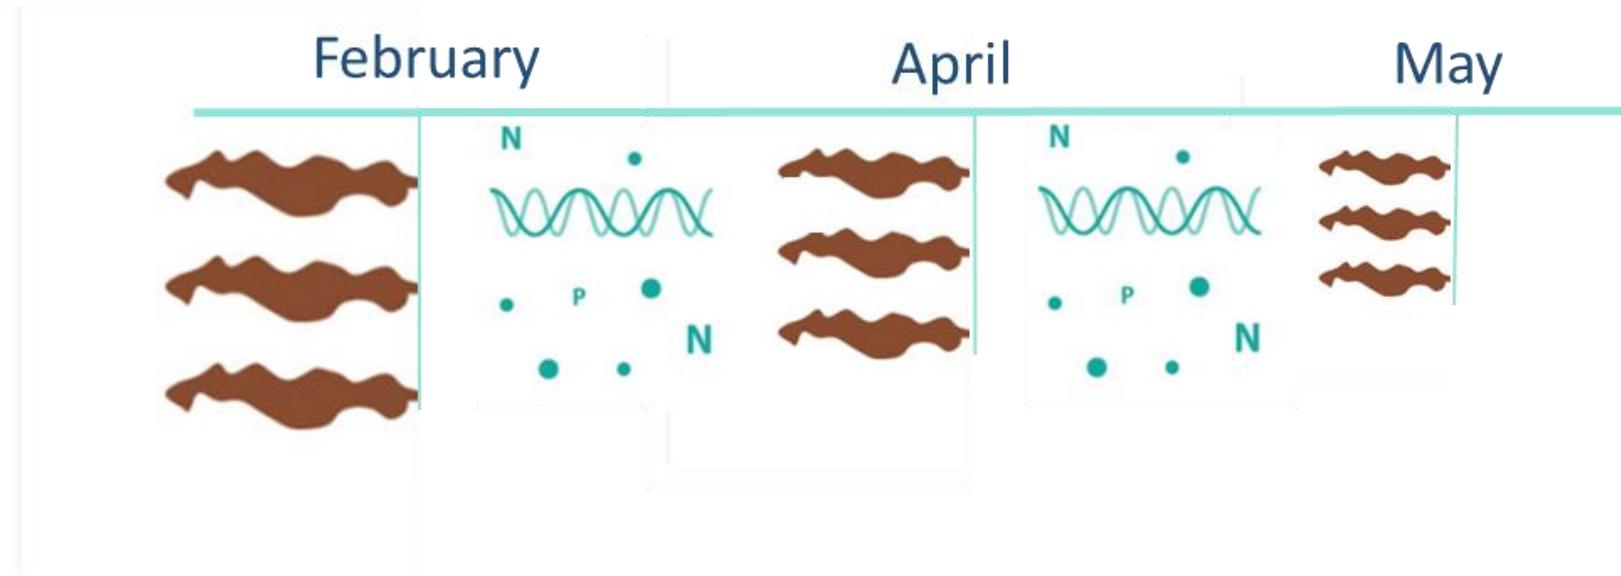

# Biofouling - taxon

- Diatoms and filamentous algae appears first
- More hydroids at lower salinity
- *Membranipora membranacea* dominant specie. Appears later. Less at lower salinities

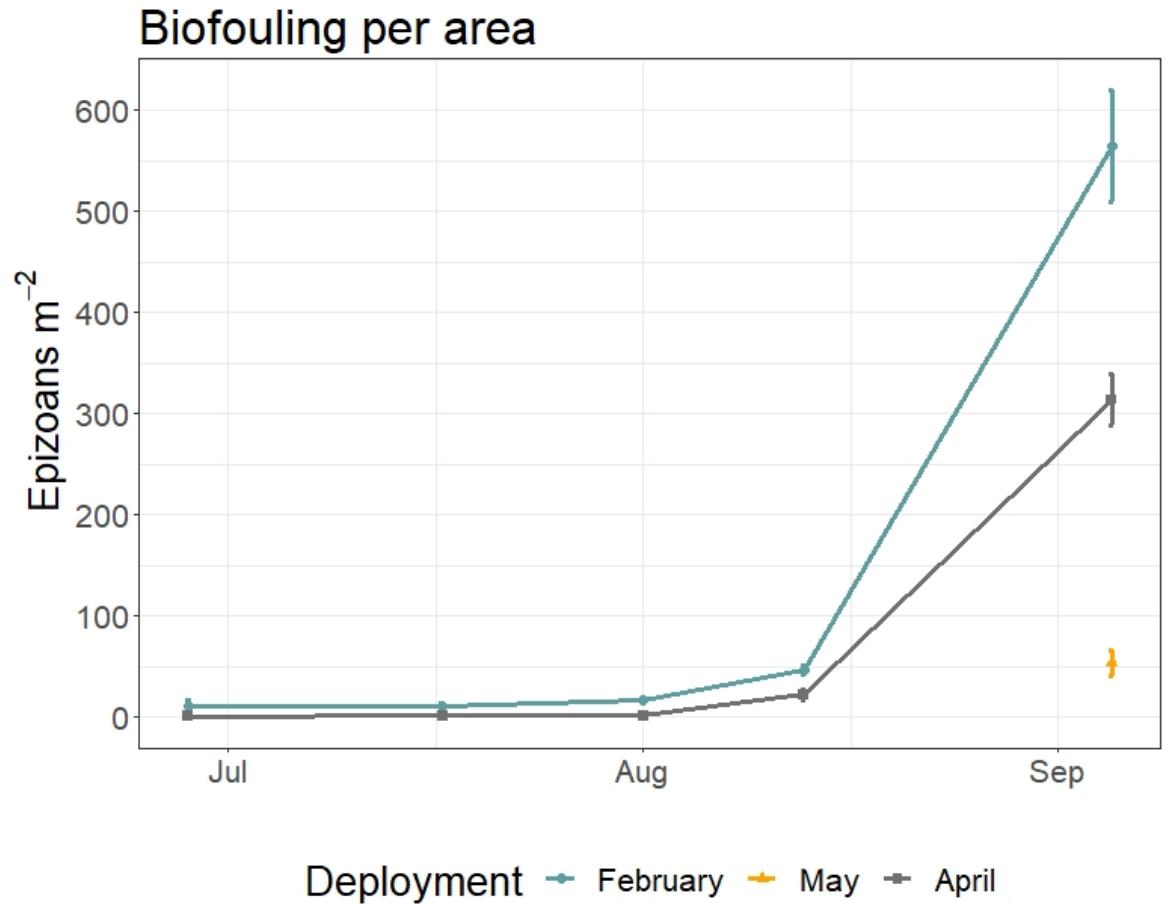

# Deployment date

# Deployment date

- Less fouling of later deployments
- Higher rate of growth and shedding on earlier deployment
- When they come, they come!

# Conclusions

- Latitudinal pattern
- Impact of temperature, salinity, light, currents
- Very location specific – know your location!
- Fouling species impact biomass yield
- Lower levels of biofouling usually accompanied with lower biomass yield
