*Projects*

Norwegian University  
of Life Sciences

# Terminology

- Cortex
  - Higher brain functions
- Amygdala
  - Fear conditioning
- Hippocampus
  - Episodic memory
- Cerebellum
  - Fine tuning
- Basal ganglia
  - Action selection

Human Brain Project

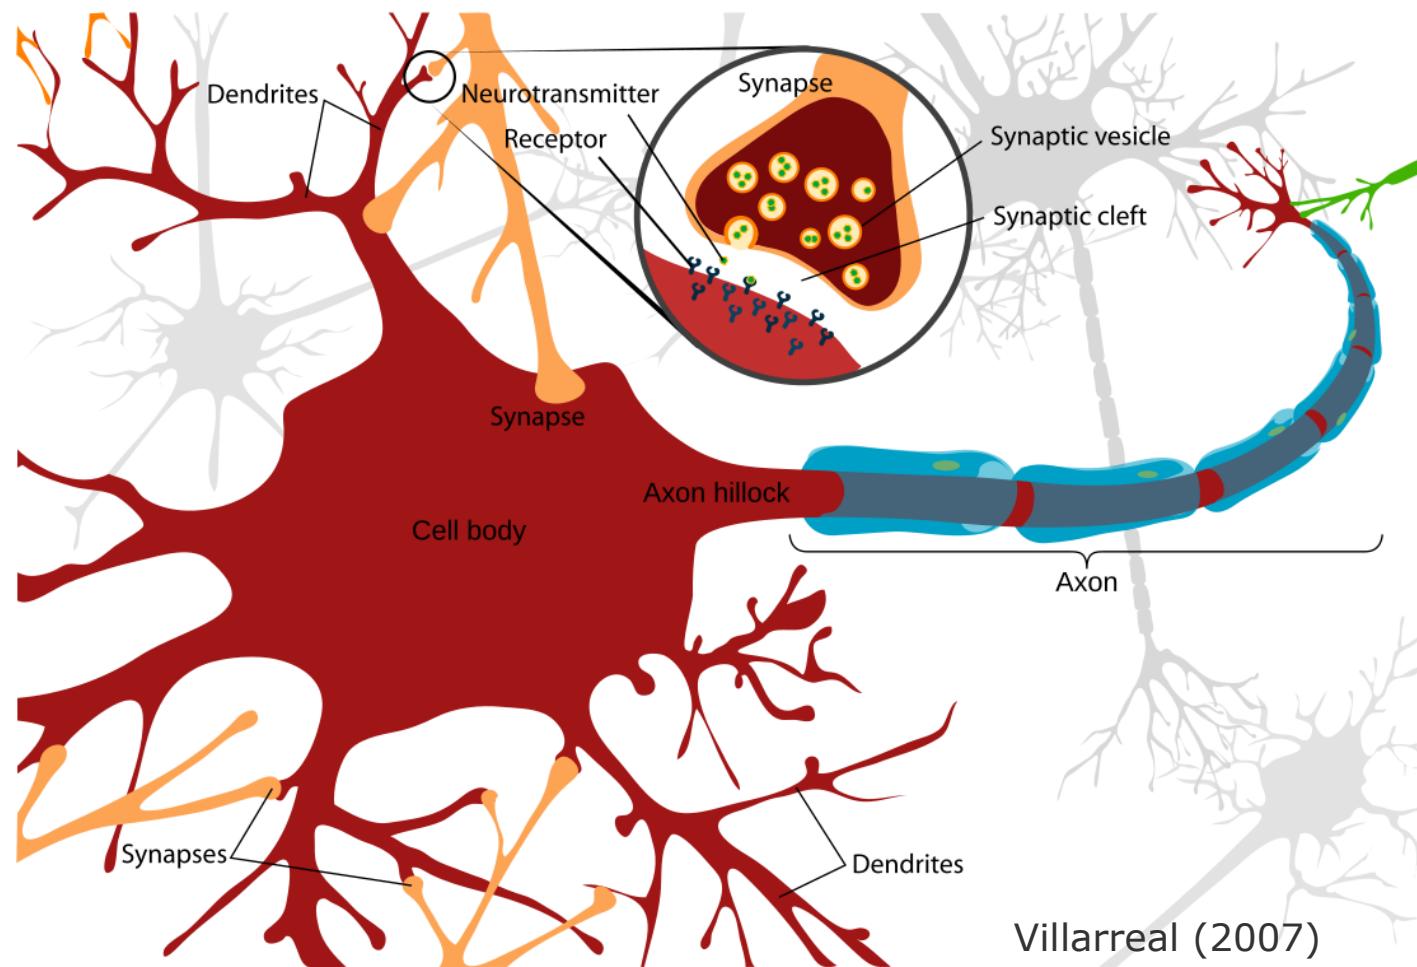

**DEEP**  
Projects

Norwegian University  
of Life Sciences

# Terminology

- Neuron
  - Microscopic building block of the brain
- Synapse
  - Connection from one neuron onto another neuron
- Spike
  - Neuronal signal
  - Electrical pulse

# Why brain-scale models?

- Brain function involves the interaction of different brain areas

Encyclopaedia Britannica (2007)

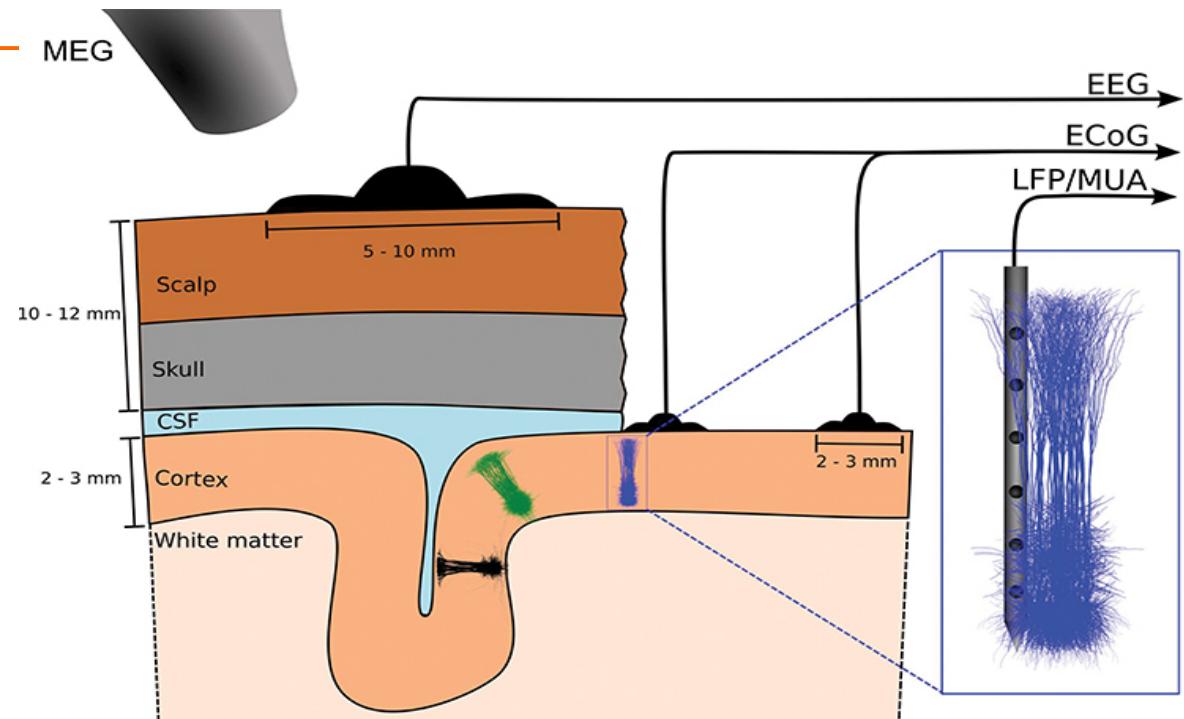

# Why brain-scale models?

- Meso-scale and macro-scale measures to investigate brain function and dysfunction

Examples:

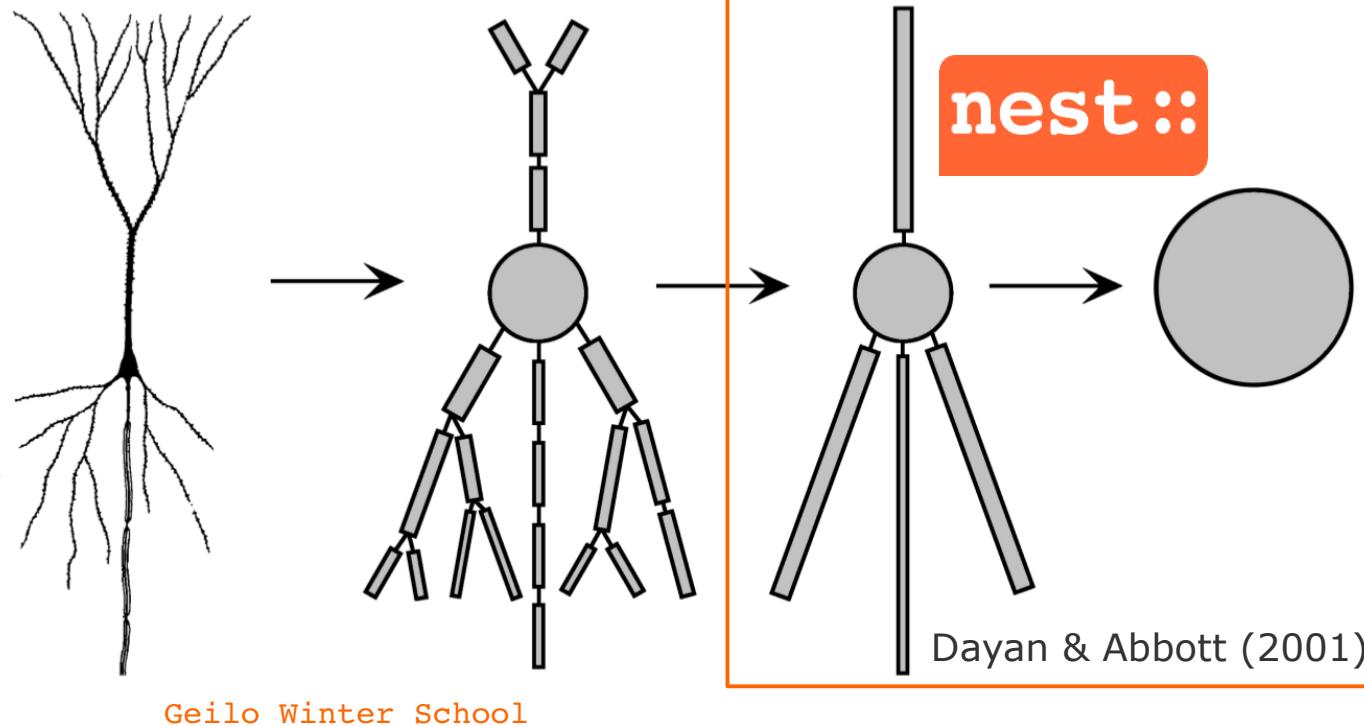

- Macro scale: EEG
- Meso scale: local field potentials (LFP)

Hagen et al. (2018)

# Level of abstraction

- Point-neuron models
  - Abstract away neuronal morphology  
(no dendrites or axon)
- Few-compartment neuron models
- Enable large-scale simulation

# Fundamental interactions

- Simple neuron models
  - Exact integration

Spike of presynaptic neuron causes small excursions of postsynaptic membrane potential

$$\dot{I}_x = 0$$

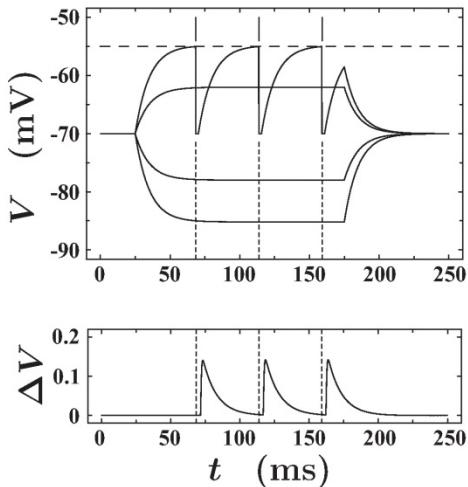

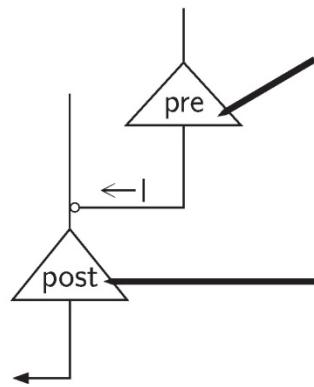

$$\dot{I}_{\text{syn}} = -\frac{1}{\tau} I_{\text{syn}} + \xi$$

$$\dot{V} = -\frac{1}{\tau_m} V + \frac{1}{C_m} I_{\text{syn}} + \frac{1}{C_m} I_x$$

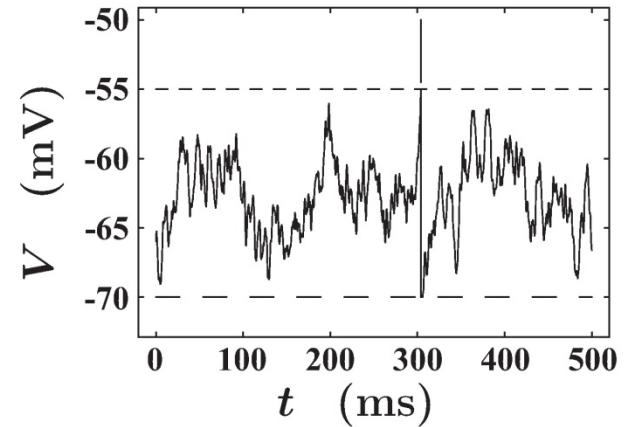

Leaky integrate-and-fire neuron model with exponential postsynaptic currents

NEST: `iaf_psc_exp`

# Fundamental interactions

Spike of presynaptic neuron causes small excursions of postsynaptic membrane potential

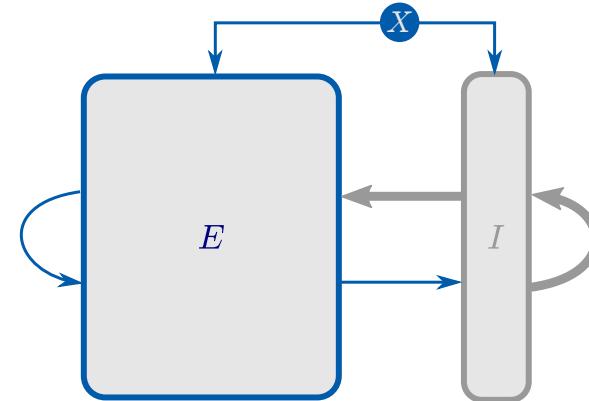

Each neuron receives input from several thousands of other neurons, which causes fluctuations of membrane potential

# Balanced random network

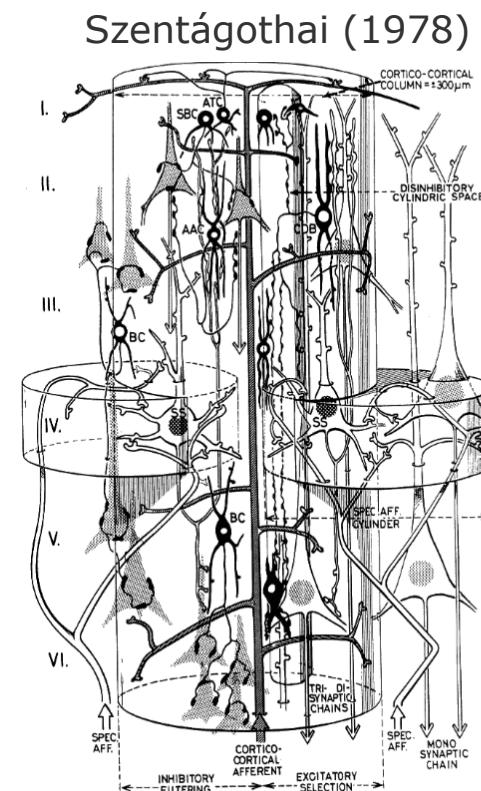

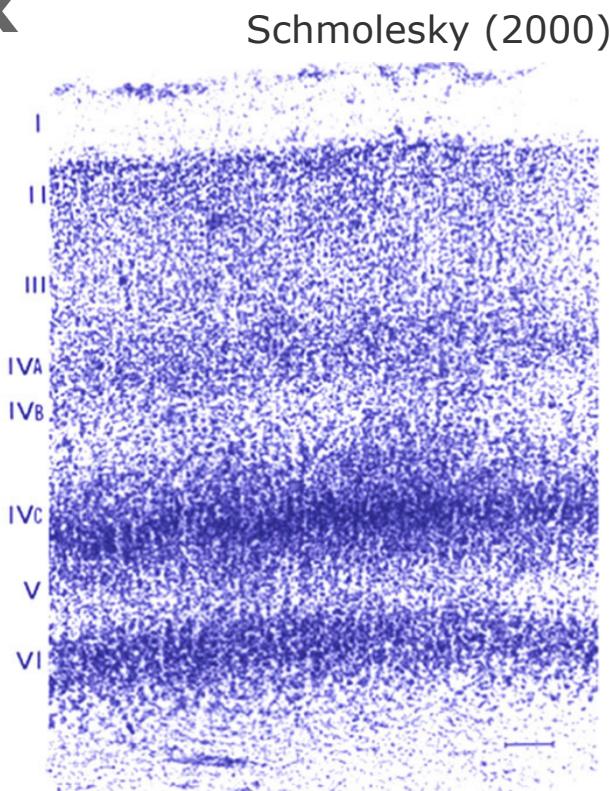

- Two populations: more excitatory than inhibitory neurons
- Stronger inhibitory than excitatory synaptic weights
- Asynchronous irregular firing as a result of excitation-inhibition balance

(Brunel, 2000)

# Layers of the cortex

- Up to six distinct vertical layers visible in stained cortical slices
- Differences in number of neurons and connectivity
  - Input layer IV
  - Layers II/III project to other areas
  - Layers V/VI project out of the cortex (e.g. thalamus)

# Microcircuit model

- Each layer represented by a balanced random network
- Connectivity between layers based on experimental data
- Different firing rates in different populations as a result of connectivity (and not of different neuron types)

Potjans & Diesmann (2012)

# Multi-area model

- Early brain-scale model at a resolution of single neurons and synapses
- Each area modeled by microcircuit model
- 4 million neurons
- 6000 synapses per neuron

Jan 20, 2020

Geilo Winter School

HP Human Brain Project

DEEP  
Projects

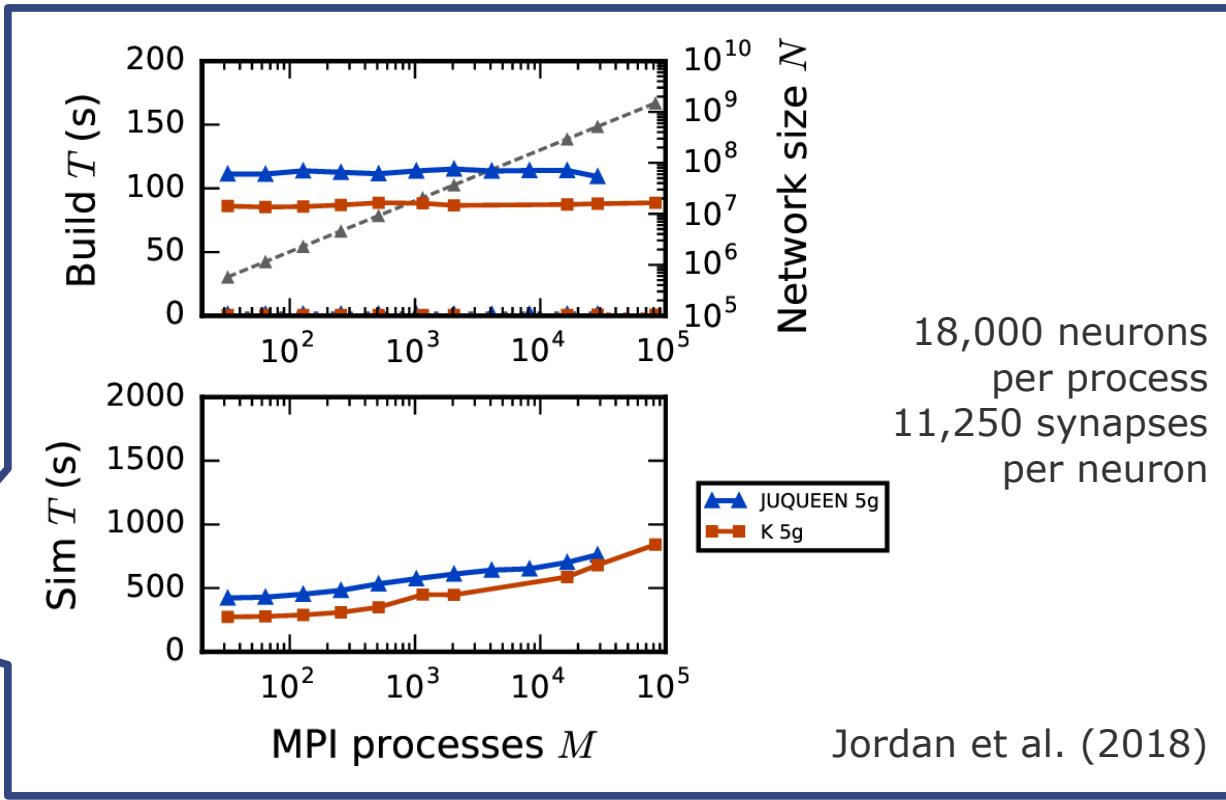

N B M U

Norwegian University  
of Life Sciences

# Multi-area model

Simulation technology  
ready for much larger  
networks

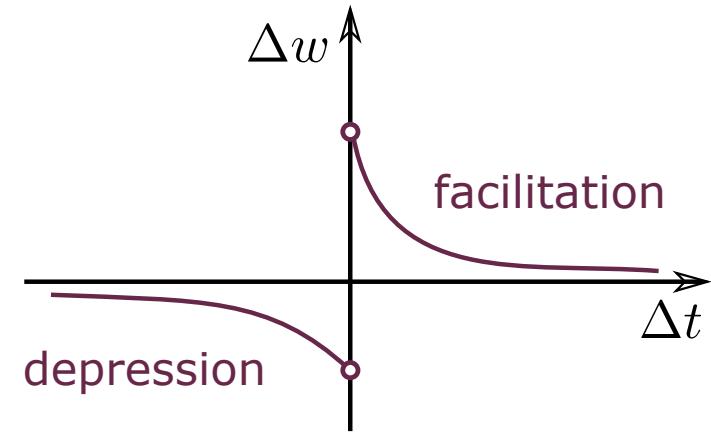

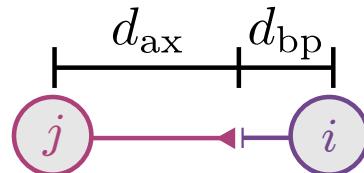

- 4 million neurons
- 6000 synapses per neuron

# Synaptic plasticity

## Spike-timing dependent plasticity (STDP)

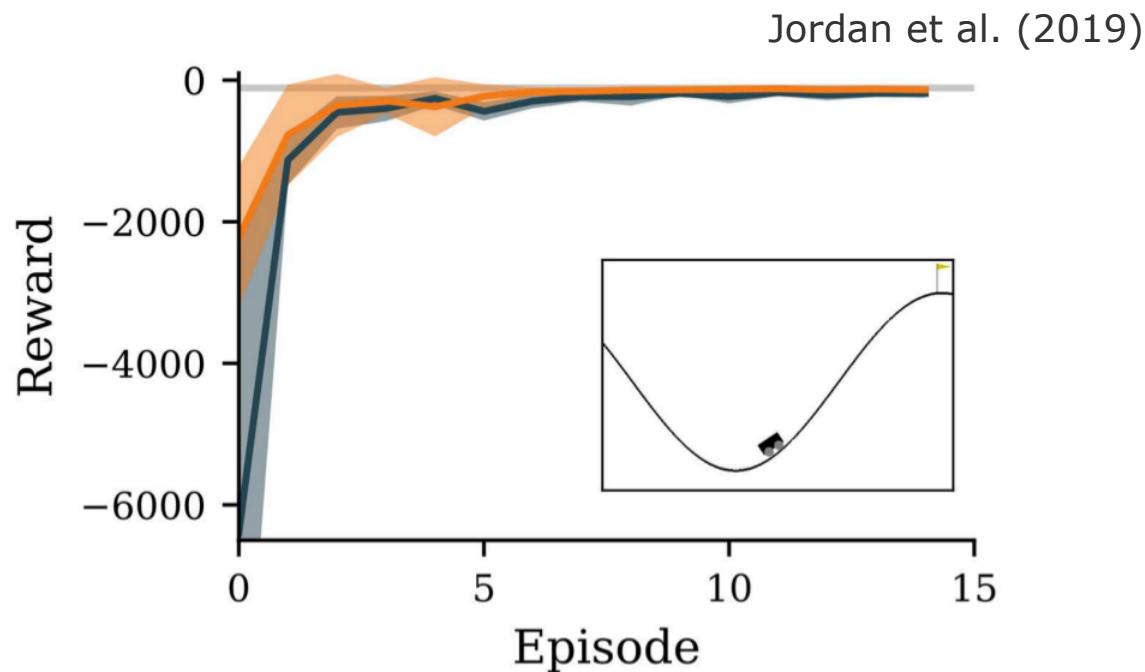

- Synaptic weight increases/decreases in response to pre- and postsynaptic spikes occurring within a few milliseconds

# Top-down modeling

## Neuronal networks solving problems

- Actor-critic architecture for reinforcement learning simulated with NEST
- Training on different environments from the OpenAI Gym
  - e.g. mountain car

# NEST Conference 2020

Where?

NMBU campus at Ås

When?

June 29/30, 2020

July 1–3, 2020 (Hackathon)
