## ***HiPerCap: Adsorption Technologies – Overview & Results***

Dr. Covadonga Pevida

*Energy Processes and Emission Reduction Group (PrEM)  
Instituto Nacional del Carbón, INCAR-CSIC*

*cpevida@incar.csic.es*

*EU-Australia Workshop, Oslo, 13<sup>th</sup> September 2017*

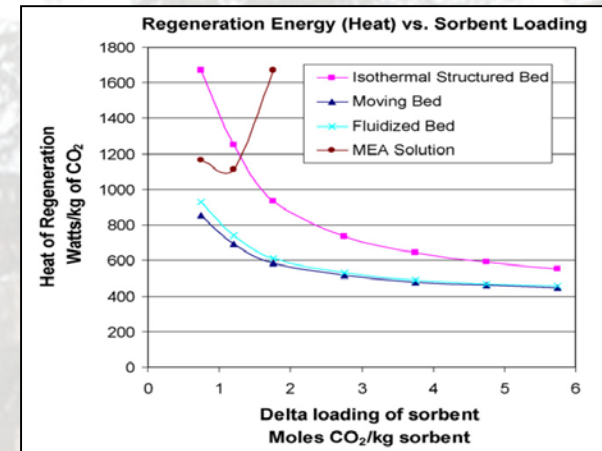

*Energy Processes and  
Emission Reduction Group*

## Advantages over *Absorption*

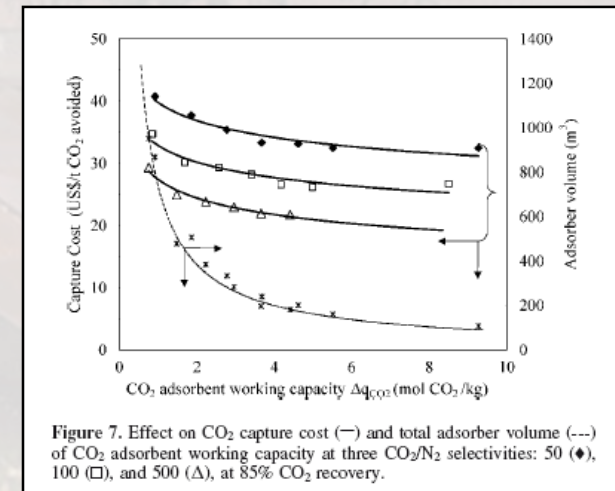

- ✓ Significantly increased contact area over solvent systems
- ✓ Reduced energy for regeneration and moving sorbent materials (if high capacity achieved)
- ✓ Elimination of liquid water (corrosion, etc.)
- ✓ Potential to reduce energy loading by 30-50%

## Challenges of CO<sub>2</sub> adsorbents

- High capacity
- High selectivity
- Adequate adsorption/desorption kinetics
- Good stability / lifetime
- Mechanical strength
- Reasonable cost

Gray *et al.* J. Greenhouse Gas Control 2, :3-8 (2008)

Ho *et al.* Ind. Eng. Chem. Res. 47, 4883-90 (2008)

	PC (w FGD)	NGCC	Oxyfuel
Volume flow (m <sup>3</sup> /h)	$2.2 \times 10^6$	$3.8 \times 10^6$	$0.5 \times 10^6$
Pressure (barg)	0.05	0.05	0.05
Temperature (°C)	90	90	170
N <sub>2</sub> (%)	71	75	
CO <sub>2</sub> (%)	12.6	3.4	62.6
Water (%)	11.1	6.9	31.5
Oxygen (%)	4.4	13.8	4.5
SO <sub>2</sub> (ppm)	200		
NOx (ppm)	670	25	

➤ Very large: pressure drop

➤ Very low: no driving force

➤ Relatively high for adsorption

➤ Ranges from 12 to 63% (wet basis)

➤ High water content

➤ SO<sub>x</sub>, NO<sub>x</sub>, ash, heavy metals, etc. present

# Post-combustion capture applications

## ADAsorb™ Process

- Flue gas passes through adsorber module where

ing Cleaner Energy

**SRI Advanced Carbon Sorbent (ACS) technology**

Pilot DR-VPsA installation – technological diagram

## Absorption

- High sorption capacity( $\Delta L$ )
- Less influence of water & other emissions
- Less side reaction

## Regeneration

- High sorption capacity( $\Delta L$ )
- Low  $C_p$
- Low  $\Delta H$

## Process

- Fast kinetics
- Reaction T (40~200 °C) &  $\Delta T \sim 60$  °C
- Fluidized-bed reactor (AI, density, size, shape)
- Maintaining integrity of sorbent

## Carbonation

Operating temperature: 40-80°C

- Little Corrosion & No volatiles
- No waste water

- Easy to control heat for exothermic reaction

## Regeneration

Operating temperature: 140-200°C

- Recover high-concentrated CO<sub>2</sub> after condensing H<sub>2</sub>O

- Use waste heat, steam for endothermic reaction

- ☐ Solid sorbents for fluidized-bed applications
  - High sorption capacity
  - High mechanical strength

- 10 MW slipstream from 500 MW coal-fired power plant
- Location: Hadong, Korea
- 200 t CO<sub>2</sub>/d
- Sorbent: KEP-CO2P2 or P3
- Targets:
  - > 80% CO<sub>2</sub> capture rate
  - <95% CO<sub>2</sub> purity
  - US\$ 30/t CO<sub>2</sub>
- Start up: October 2013

10 MW Pilot Plant at KOSPO's Hadong coal-fired power plant, Unit # 8

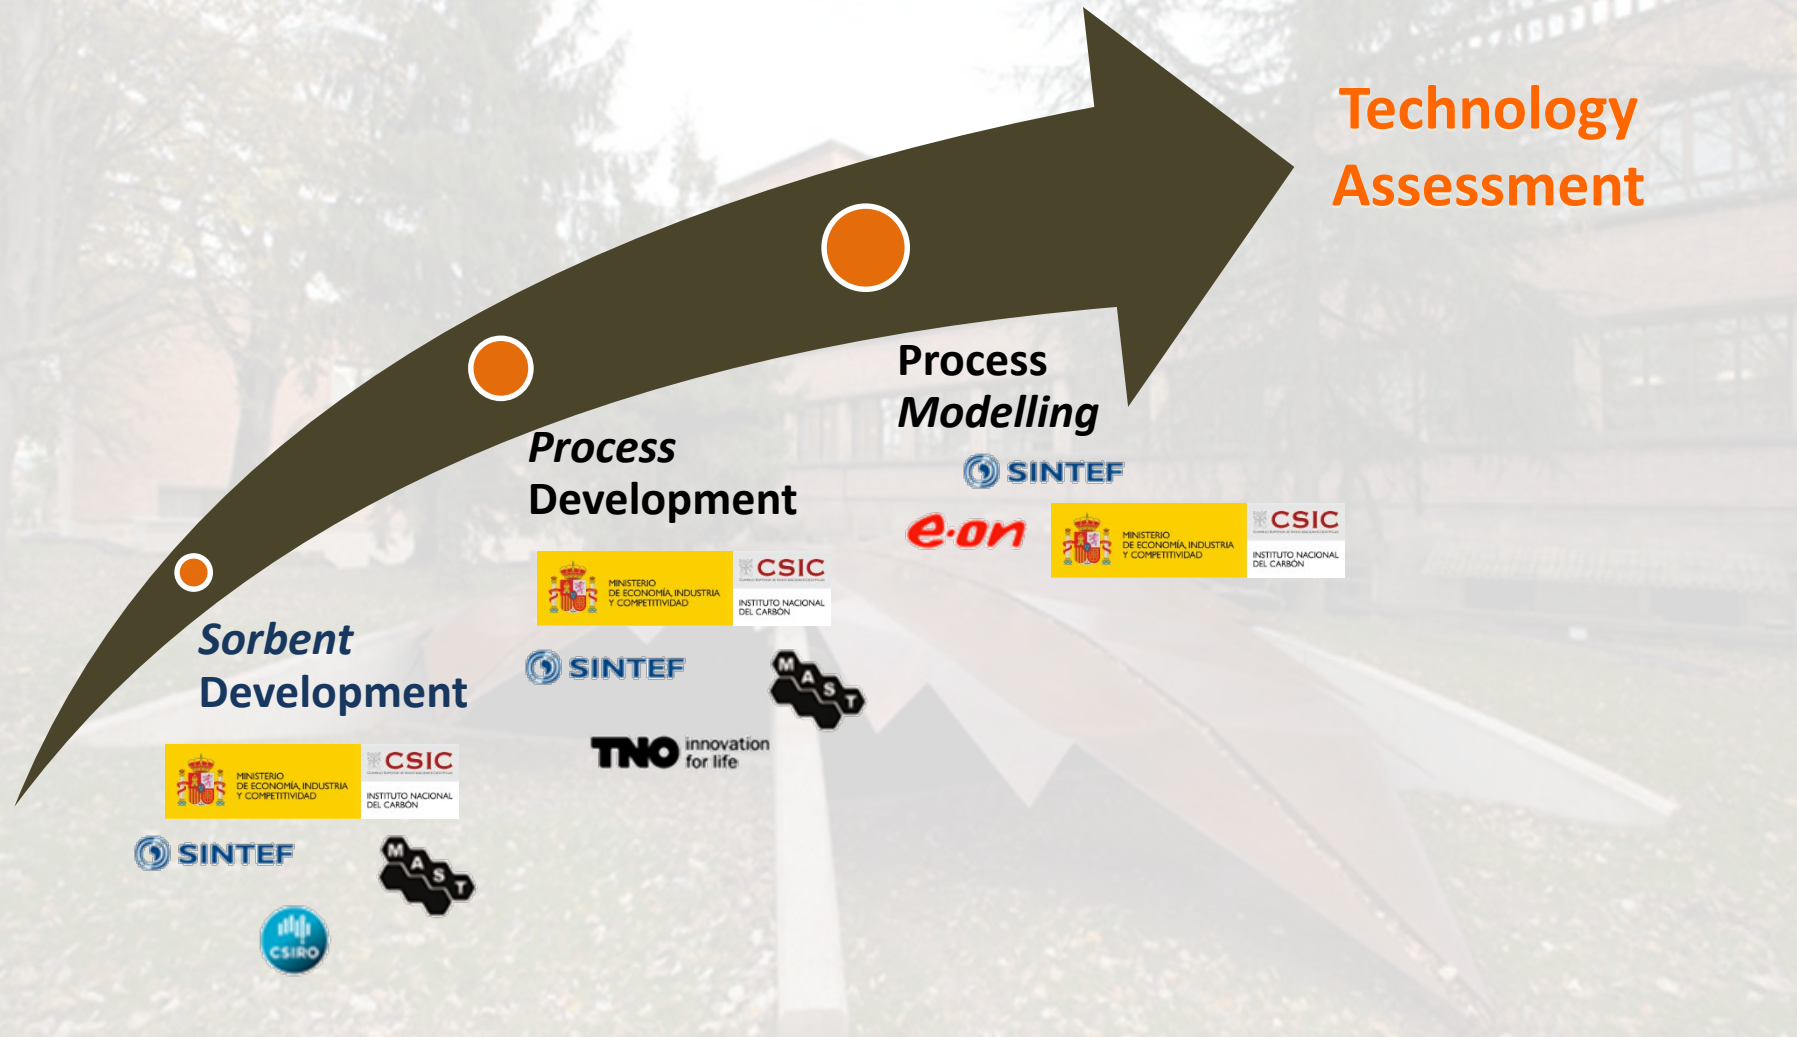

The main objective was to prove **adsorption** with **low-temperature solid sorbents** as a high efficiency and environmentally benign technology for post-combustion CO<sub>2</sub> capture by means of experimental and modelling work

- Produce a **particulate solid adsorbent** for a moving bed reactor having suitable cyclic capacity under post-combustion conditions (e.g. >2.5 mmol/g for the high surface area sorbents) and that can withstand a 100°C temperature change within 3-4 minutes.
- Produce a structured **carbon monolith** sorbent with substantial equilibrium carbon dioxide uptake in high relative humidity environments (e.g. >1.5 mmol/g at 150 mbar CO<sub>2</sub> and 20°C) and with acceptable adsorption/desorption kinetics. The monoliths should also have enhanced thermal conductivity characteristics of better than 2W/mK.
- **Evaluate** and **model moving** and **fixed bed** based adsorption processes that combine low pressure drop and high thermal efficiency and determine the process performance.

Data generated were transferred for process assessment in WP4

## ***Metal-Organic Frameworks(MOF)***

Cristaline compounds integrated by metal ions linked by organic ligands in a forming a porous network. Extremely high porosity suitable for gas storage and purification. Air/moisture sensitive.

## ***Zeolites***

Aluminosilicate molecular sieves. High capacity and selective CO<sub>2</sub> sorbents in the higher pressure range. Very sensitive to water.

## ***Carbon-based***

From activated carbons to carbon molecular sieves. Less sensitiveness to water, easy regeneration and lower cost. Low temperature CO<sub>2</sub> sorption.

## ***Functionalised porous materials***

- Surface (e.g. amine grafted)
- Matrix (e.g. N containing polymer)

## Ideal adsorbent:

- ✓ Low cost
- ✓ Availability
- ✓ High capacity
- ✓ High selectivity towards CO<sub>2</sub>
- ✓ Ease of regeneration
- ✓ High stability/durability

## Carbon materials

Cost  
Ease of regeneration  
Water tolerance  
Durability  
Availability

## Carbon precursors selected within HiPerCap:

- Agricultural by-products
- Phenolic resins
- Natural polymers/precursors

# Sorbent & Process development

## I. Sorbent Production

## II. Evaluation & Modelling

- ✓ Characterization
- ✓ Pure component adsorption isotherms at selected T: CO<sub>2</sub>, N<sub>2</sub>, H<sub>2</sub>O

➡ *Thermodynamics of adsorption*

- Multicomponent adsorption experiments

Selectivity  
Kinetics of adsorption  
Evaluation of operating conditions  
Influence of impurities  
Validation of adsorption model

➡ *Fixed-bed adsorption-desorption*

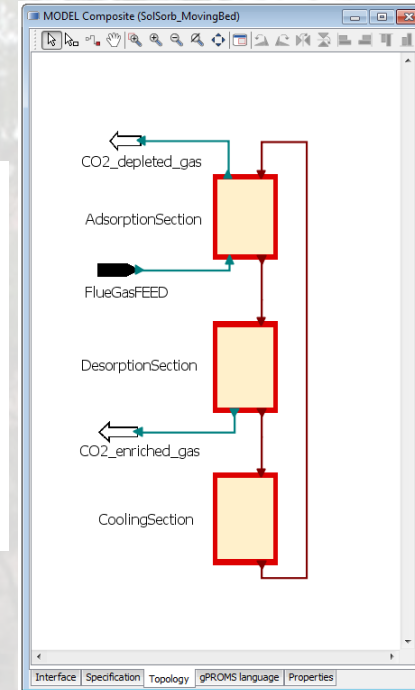

## III. Simulation

➡ *Design of adsorption-based CO<sub>2</sub> capture unit*

### Fixed-bed: Aspen Adsorption

### Moving-bed: gPROMS

Post-combustion CO<sub>2</sub> capture (PCC)

## Fixed-bed TSA (FBTSA)

### Phenolic resin honeycomb carbon monolith:

- ✓ Low pressure drop
- ✓ Effective heat transfer
- ✓ High stability
- **Challenges:** throughput & working capacity

215Sep30

## Moving-bed TSA (MBTSA)

### Phenolic resin carbon beads:

- ✓ Low pressure drop
- ✓ Hardly no attrition
- ✓ Uses heat in flue gas for regeneration
- **Challenges:** hydrodynamics & particle residence time in regeneration

214Jun42

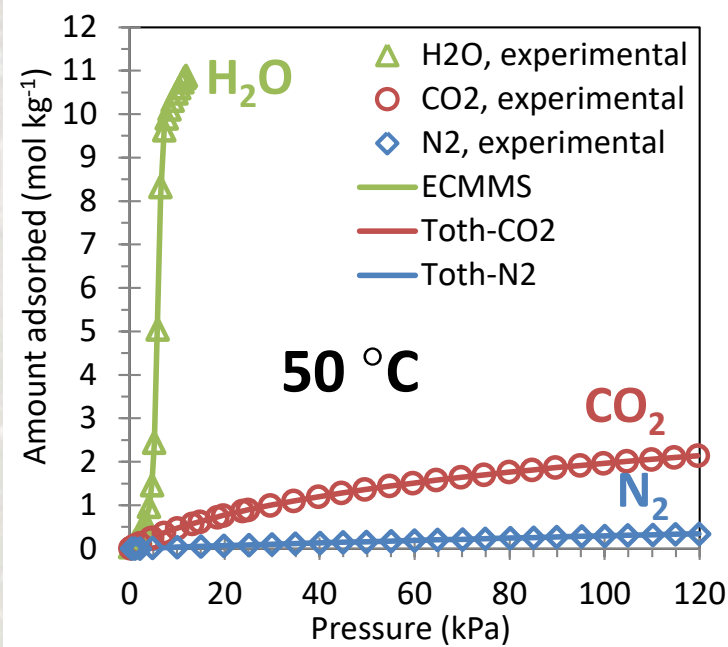

215Sep30

## Adsorption properties

214Jun42

	Monolith	Beads	units
BET surface area	708	1314	m <sup>2</sup> g <sup>-1</sup>
Total pore volume	0.29	1.22	cm <sup>3</sup> g <sup>-1</sup>
Narrow micropore volume	0.29	0.22	cm <sup>3</sup> g <sup>-1</sup>
Narrow micropore width	0.57	0.79	nm

CSIC designed, developed and scaled up several **FBTSA post-combustion CO<sub>2</sub> capture** processes that meet the following specifications:

- ✓  $\geq 85\%$  CO<sub>2</sub> capture rate from the 800 MW<sub>e</sub> advanced supercritical coal reference plant
- ✓ The CO<sub>2</sub> product is delivered to the compression stage with a purity of  $\geq 95\%$  (dry basis) at 2 bar and 30 °C

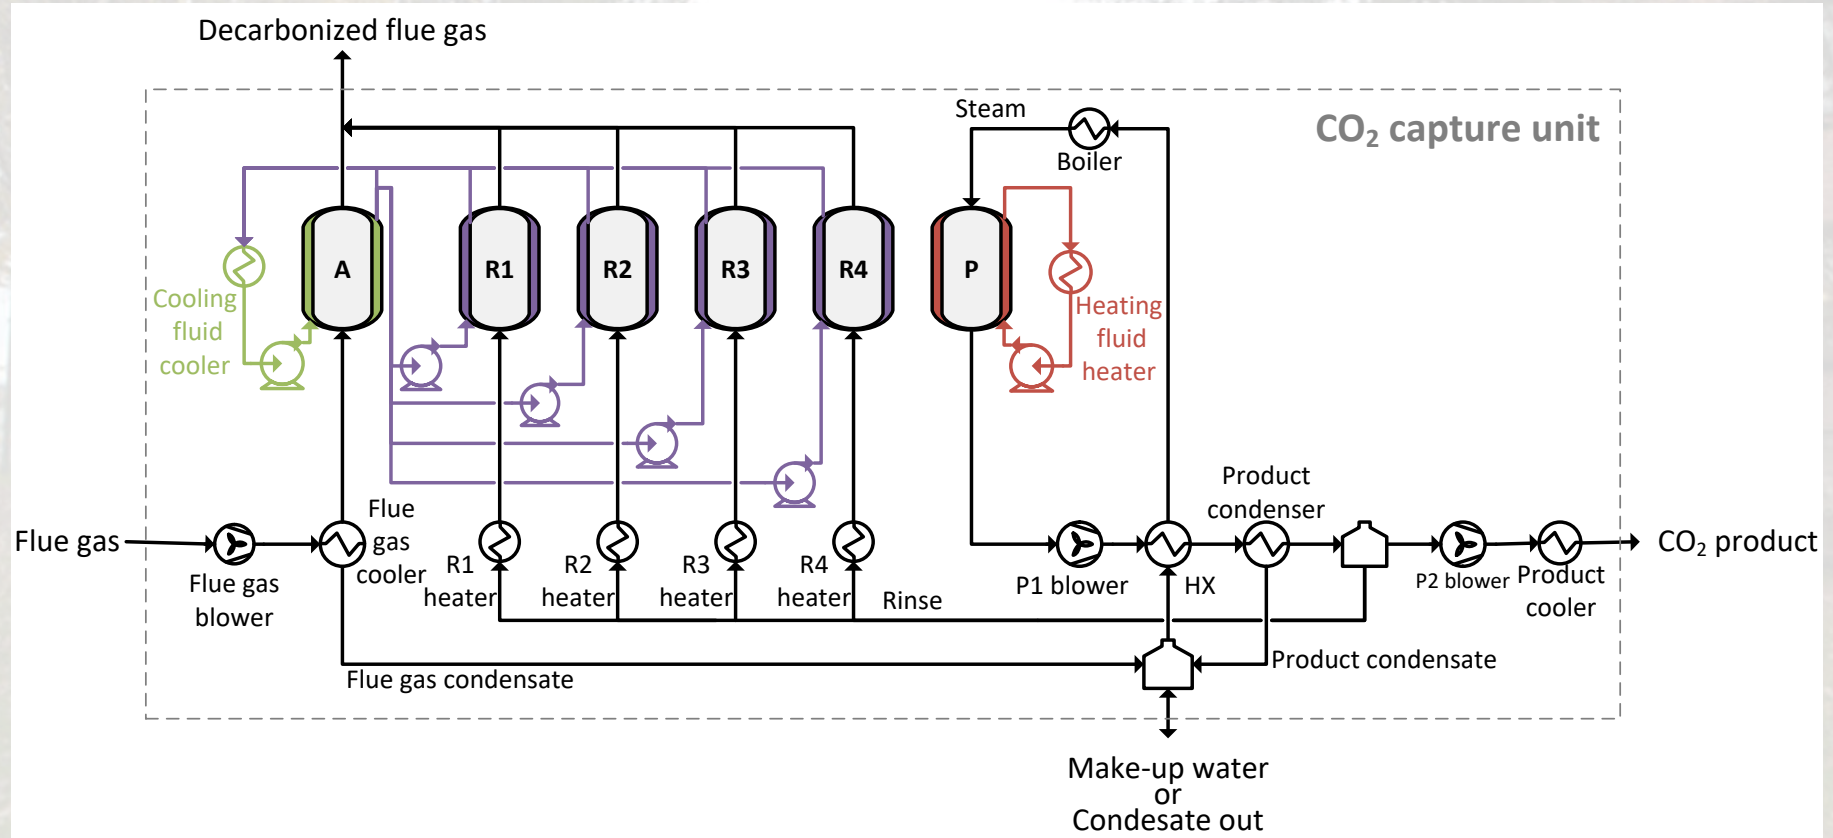

## TSA with steam stripping

Carbon honeycomb monoliths (D = 3 cm; H = 0.7 m) installed in 24 adsorbers

Success cases:

- **Case 1:** the flue gas is fed to the adsorption capture unit directly after the desulfurization unit, at 47 °C
- **Case 2:** the flue gas is cooled down to 30.78 °C prior to be fed to the adsorption capture unit

**Case 2: flue gas is cooled down to 30.78 °C prior to adsorption unit**

Parameter	Case 1	Case 2	Case 2b	Units
Purity of the CO <sub>2</sub> product (dry basis)	95.4	95.6	95.7	%
CO <sub>2</sub> capture rate	85.4	85.4	88.6	%
Productivity	0.35	0.40	0.52	kg <sub>CO2</sub> kg <sub>adsorbent</sub> <sup>-1</sup> h <sup>-1</sup>
Specific heat duty	4.89	3.59	2.89	MJ <sub>th</sub> kg <sup>-1</sup> CO <sub>2</sub>
Specific cooling duty	4.40	3.36	2.79	MJ <sub>th</sub> kg <sup>-1</sup> CO <sub>2</sub>
Specific electricity consumption	123	127	118	kJ <sub>e</sub> kg <sup>-1</sup> CO <sub>2</sub>
Total amount of adsorbent	1428	1256	1005	tons

*Case 2b evaluates the influence of faster adsorption kinetics on Case 2 configuration*

SINTEF designed and scaled up several **MBTSA post-combustion CO<sub>2</sub> capture** processes that meet the following specification:

- ✓  $\geq 85\%$  CO<sub>2</sub> capture rate from the 800 MW<sub>e</sub> advanced supercritical coal reference plant

## Moving bed TSA

Four units (D = 10 m; H = 25 m) installed in parallel

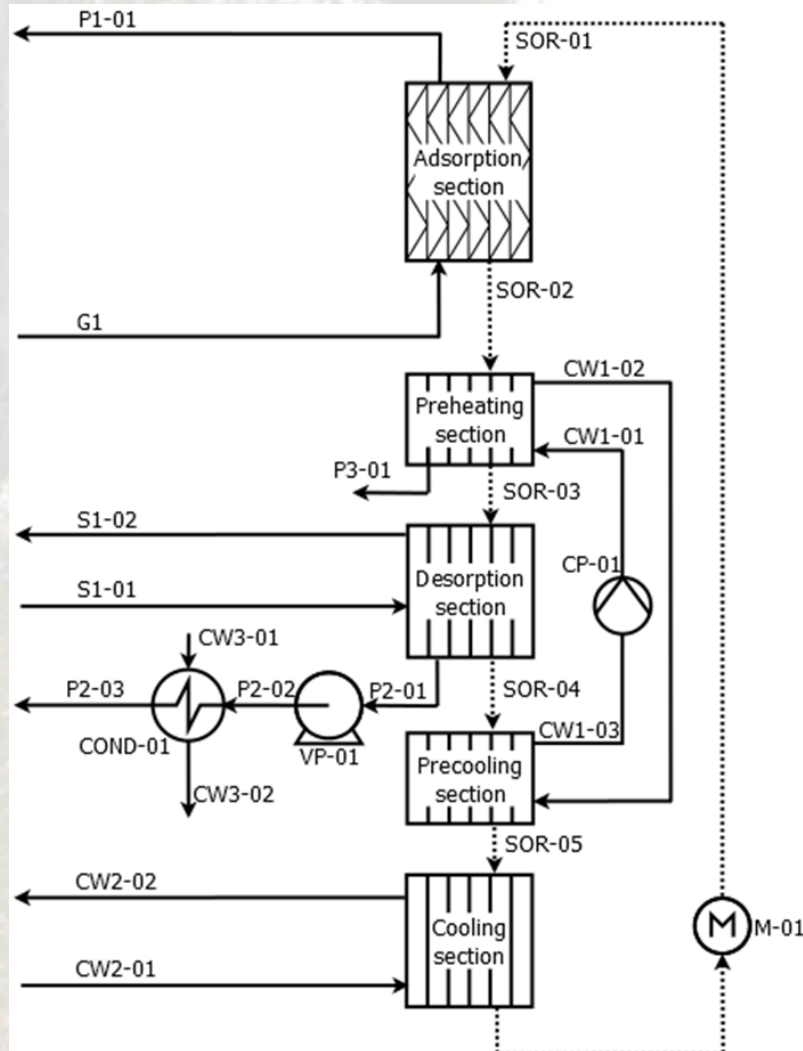

Basic configurations (A & B): CO<sub>2</sub> purity very low ( $< 95\%$ )

Success cases:

- **Configurations D:** includes preheating section and recycle of extracted gas from top of preheating section into the flue gas feed.

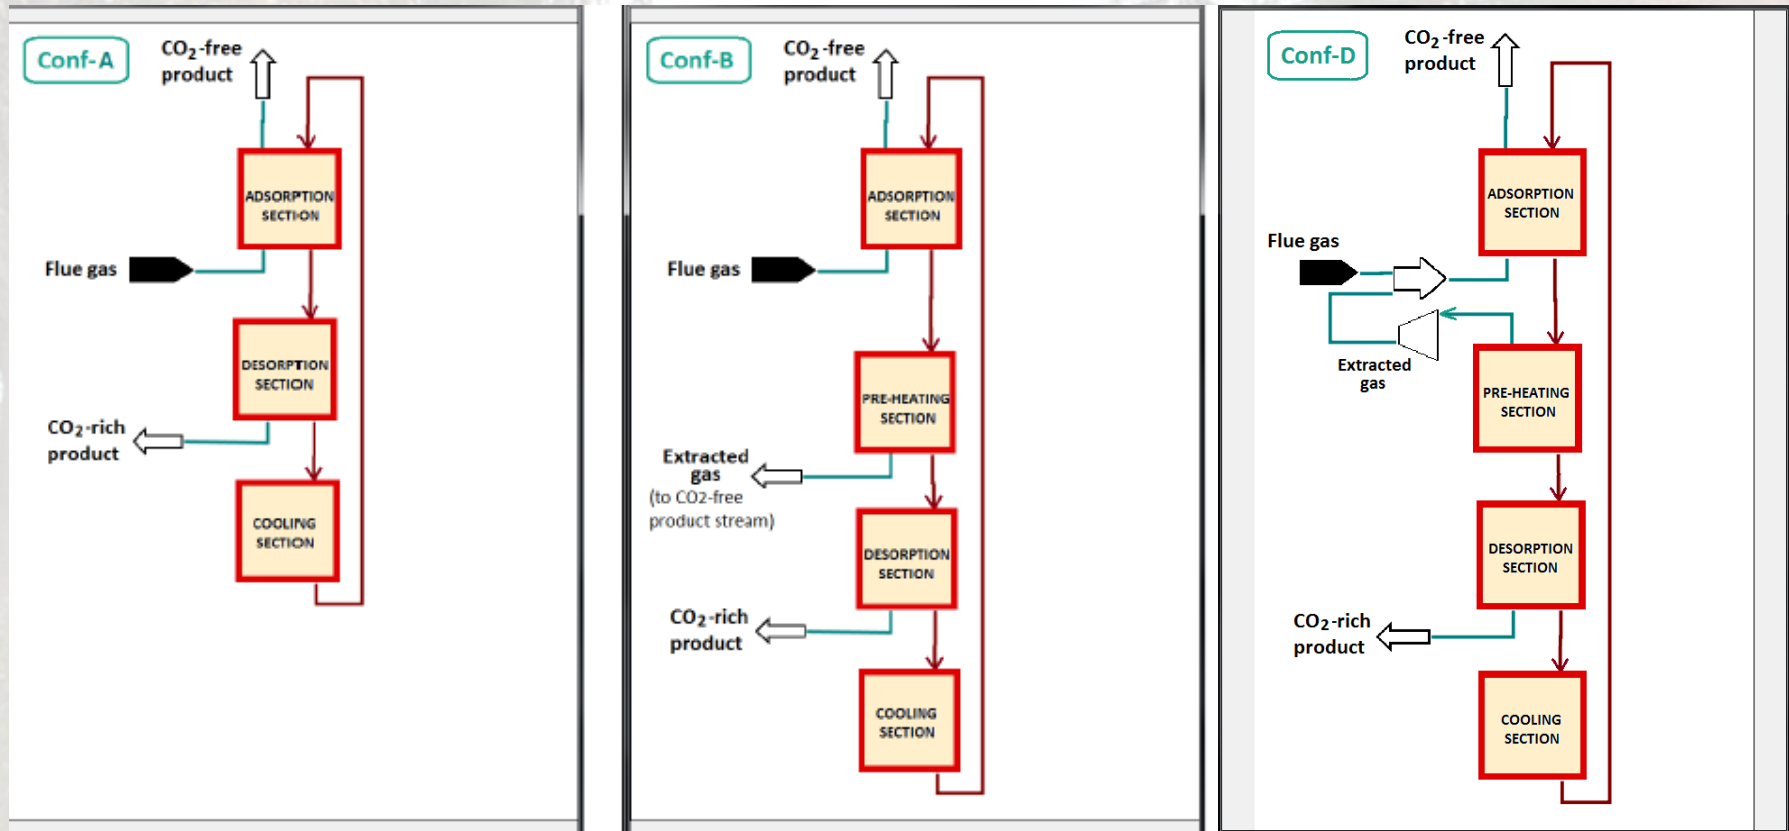

## 4 parallel moving bed TSA units

Name/tag	info
<b>Stream</b>	
CW1-01	Cooling water for heat recovery at preheater inlet (closed loop)
CW1-02	Water for heat recovery at preheater outlet (closed loop)
CW1-03	Water for heat recovery at precooling outlet (closed loop)
CW2-01	Cooling water from power plant for sorbent cooling (supply)
CW2-02	Cooling water used for sorbent cooling (supply)
CW3-01	Cooling water for condenser - drying of CO <sub>2</sub> -rich product (supply)
CW3-02	Cooling water for condenser - drying of CO <sub>2</sub> -rich product (return)
G1	Feed gas (flue gas from power plant)
P1-01	CO <sub>2</sub> -depleted product
P2-01	CO <sub>2</sub> -rich product (wet)
P2-02	CO <sub>2</sub> -rich product after condenser
SOR-01	Sorbent at adsorption section inlet
SOR-02	Sorbent at adsorption section outlet/preheating section inlet
SOR-03	Sorbent at preheating section outlet/desorption section inlet
SOR-04	Sorbent at desorption section outlet/precooling section inlet
SOR-05	Sorbent at precooling section outlet/cooling section inlet
S1-01	Steam from power plant (for sorbent regeneration)
S1-02	Exhaust steam back to power plant (after sorbent regeneration)
<b>Separation equipment</b>	
Adsorption section	
Preheating section (heat exchanger)	
Desorption section (heat exchanger)	
Cooling section (heat exchanger)	
Cooling section (heat exchanger)	
<b>Auxiliary equipment</b>	
M-01	Motor for sorbent circulation
CP-01	Circulating pump
VP-01	Vacuum pump
COND-01	Condenser (for drying of CO <sub>2</sub> -rich product)

## 4 parallel moving bed TSA units

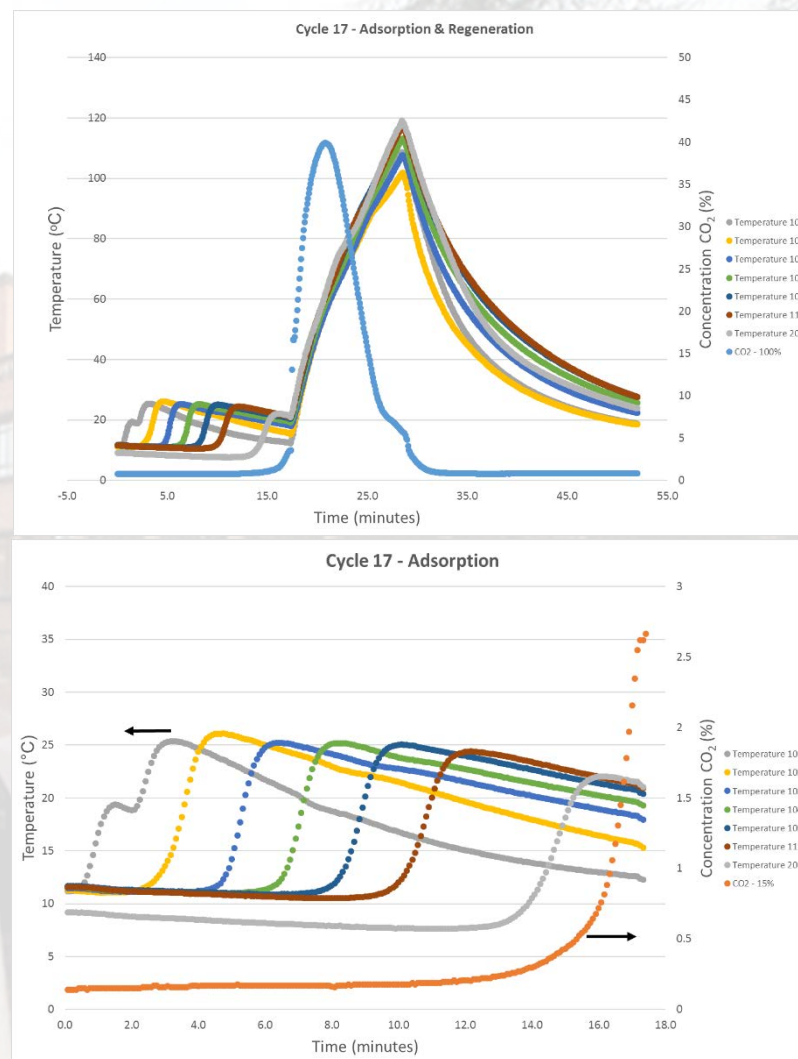

Parameter	Conf A	Conf B	Conf D	Units
Purity of the CO <sub>2</sub> product (dry basis)	65	72	94.6	%
CO <sub>2</sub> capture rate	86	78	85.6	%
Heat duty (external heat)	410	410	NA	MW <sub>th</sub>
Recovered heat	660	660	NA	MW <sub>th</sub>
Cooling duty	382	382	NA	MW <sub>th</sub>
Specific electricity consumption	23.9	23.9	NA	kJ <sub>e</sub> kg <sup>-1</sup> CO <sub>2</sub>
Amount of circulating sorbent (per unit)	2280	2280	2550	kg s <sup>-1</sup>
Total amount of adsorbent	7982	7982	NA	tons

# Testing with real flue gas from power plant

TNO  
innovation  
for life

MAST Carbon monolith module

*Stable performance over 24 cycles of adsorption-regeneration*

- ✓ Both MBTSA and FBTSA reach the targets defined in HiPerCap:  
 $\geq 85\%$  CO<sub>2</sub> capture rate with  $\geq 95\%$  CO<sub>2</sub> purity from the 800 MW<sub>e</sub> advanced supercritical coal reference plant.
- ✓ Reducing the energy penalty of the TSA capture unit is challenging and requires action on the solid sorbent and engineering developments.
- ✓ Testing with real flue gas demonstrated the stability of the adsorption based system.
