Content

1. Introduction
 1. CNRS tasks in C123
 2. OCM vs. OCoM
 3. Test Rig
2. Results on catalytic powders – Effects of
 1. CO₂
 2. Reactor pressure
3. Results on supported catalyst – Effects of
 1. CO₂
 2. Reaction temperature
4. Conclusions & perspectives

Introduction

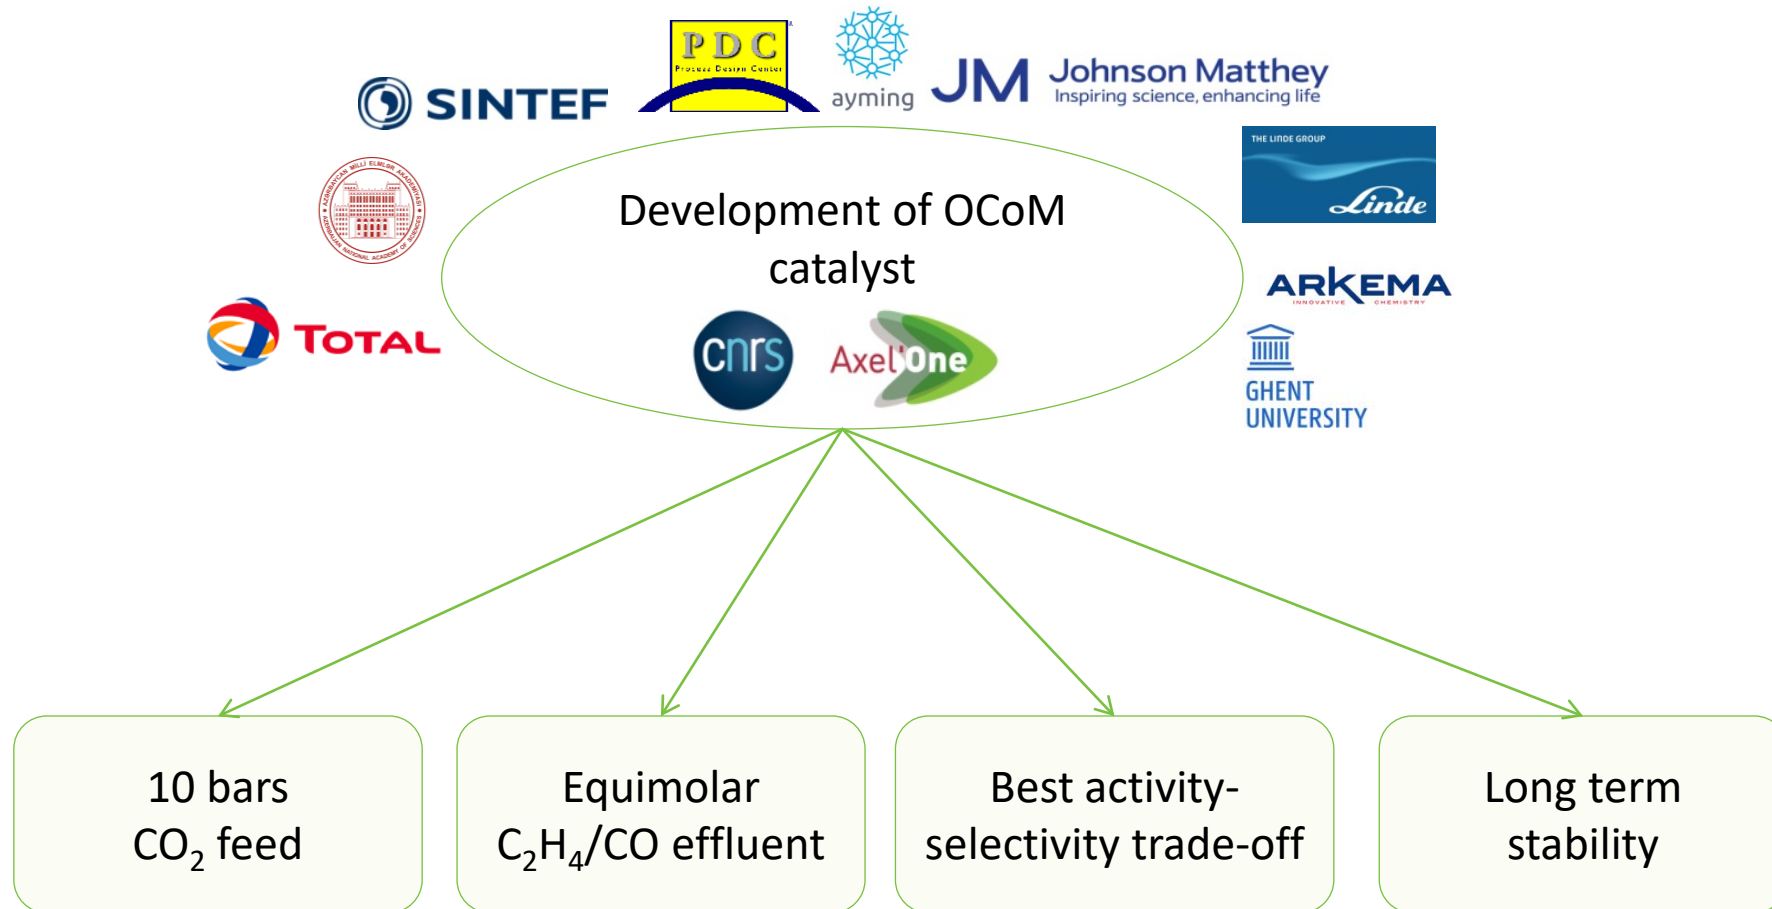

Introduction

- CNRS tasks in C123

Introduction

- OCoM specifications

Introduction

■ OCoM reaction

Introduced by Keller and Bhasin in 1982

High exothermicity

1 $\Delta_r G^\circ(800^\circ\text{C}) = -59 \text{ kJ}\cdot\text{mol}^{-1}$

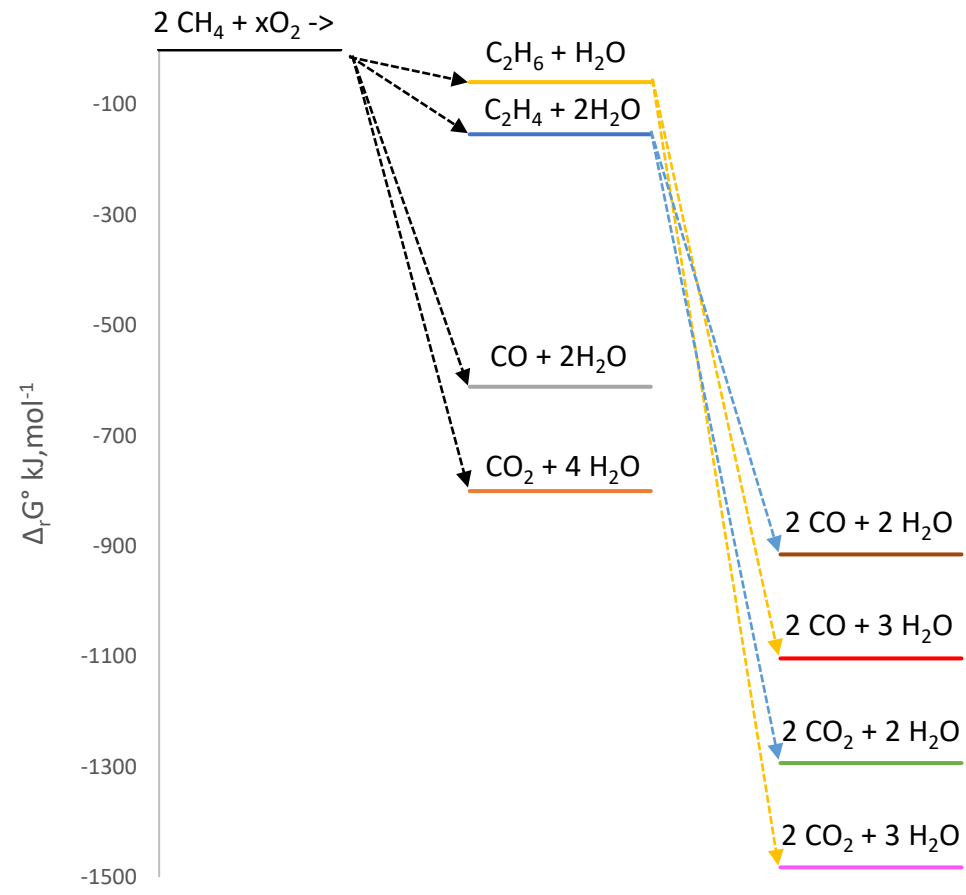

2 $\Delta_r G^\circ(800^\circ\text{C}) = -153 \text{ kJ}\cdot\text{mol}^{-1}$

Introduction

- OCoM reaction

Total oxidations are thermodynamically favored

Free Gibbs Energy of OCoM reactions

- 1 $\Delta_r G^\circ(800^\circ\text{C}) = -59 \text{ kJ}\cdot\text{mol}^{-1}$
- 2 $\Delta_r G^\circ(800^\circ\text{C}) = -153 \text{ kJ}\cdot\text{mol}^{-1}$
- 3 $\Delta_r G^\circ(800^\circ\text{C}) = -611 \text{ kJ}\cdot\text{mol}^{-1}$
- 4 $\Delta_r G^\circ(800^\circ\text{C}) = -800 \text{ kJ}\cdot\text{mol}^{-1}$
- 5 $\Delta_r G^\circ(800^\circ\text{C}) = -915 \text{ kJ}\cdot\text{mol}^{-1}$
- 6 $\Delta_r G^\circ(800^\circ\text{C}) = -1104 \text{ kJ}\cdot\text{mol}^{-1}$
- 7 $\Delta_r G^\circ(800^\circ\text{C}) = -1293 \text{ kJ}\cdot\text{mol}^{-1}$
- 8 $\Delta_r G^\circ(800^\circ\text{C}) = -1482 \text{ kJ}\cdot\text{mol}^{-1}$

Introduction

■ OCM state of the art catalysts

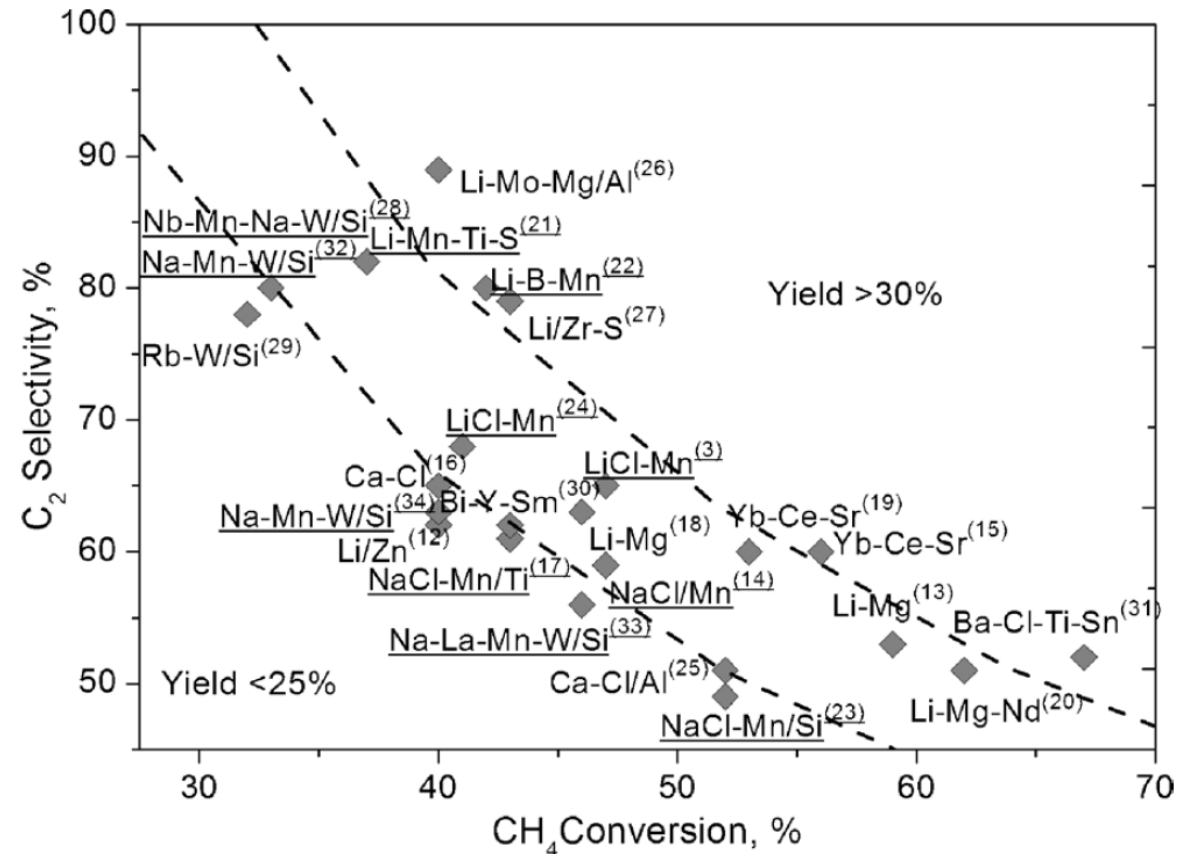

Mn- & La-based catalyst

- Good C₂ yield (selectivity vs activity)
- Good thermal stability (harsh operating conditions)
- Unsupported (powder) catalysts

■ Objective for OCoM

Development of a supported catalyst

- Catalytically inert at high temperature
- Good thermal conductivity (exothermicity)
- Without mass transfert limitation

Zavyalova, U., Holena, M., Schlögl, R. and Baerns, M. (2011), Statistical Analysis of Past Catalytic Data on Oxidative Methane Coupling for New Insights into the Composition of High-Performance Catalysts. ChemCatChem, 3: 1935-1947

Introduction

■ Test rig

Standard testing conditions

- ❑ **High Temperature:** 800°C (up to 900°C)
- ❑ **Medium Pressure:** up to 10 bars
- ❑ **Reactor diameter:** 3 – 6 mm
- ❑ **Inlet composition:** CH₄: O₂: N₂: CO₂/He = 60: 15: 15: 10
- ❑ **GHSV:** 2,000-9,000 h⁻¹
- ❑ Either **powder** or **supported** catalysts loading

Results for powders

<u>Operating conditions</u>	
<p>Temperature: 800 °C</p> <p>Pressure: 1->3 atm</p> <p>Dilution: 5 %wt of catalyst with 95 %wt SiO₂</p>	
<p>Catalyst: Mn-based / La-based (powder)</p>	
Without CO ₂	With CO ₂
<p>Feed: CH₄, O₂, N₂, He (60/15/15/10 %Vol)</p>	<p>Feed: CH₄, O₂, N₂, CO₂ (60/15/15/10 %Vol)</p>

Powders - La-based catalyst / Effect of CO₂

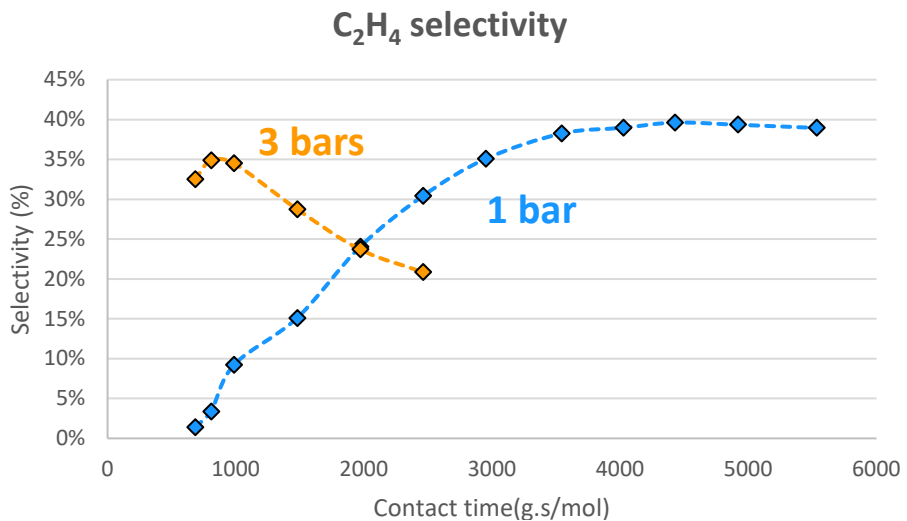

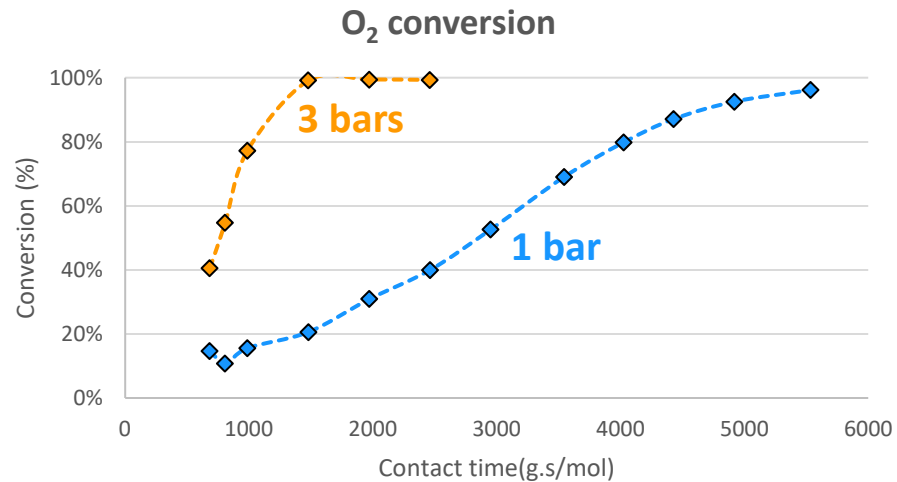

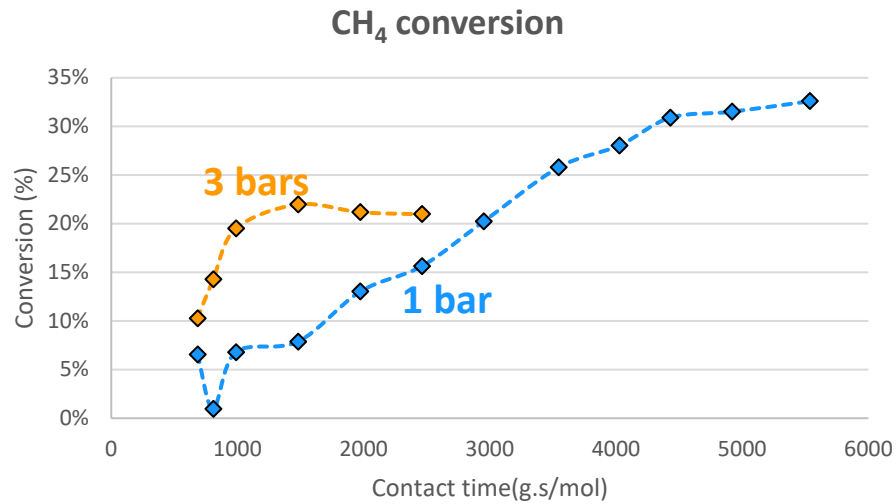

➤ La-based catalysts are affected by the addition of CO₂

Powders - Mn-based catalyst / Effect of CO₂

- Negligible effect of CO₂ on Mn-based catalyst performance
- No deactivation noticed after 1 day of reaction

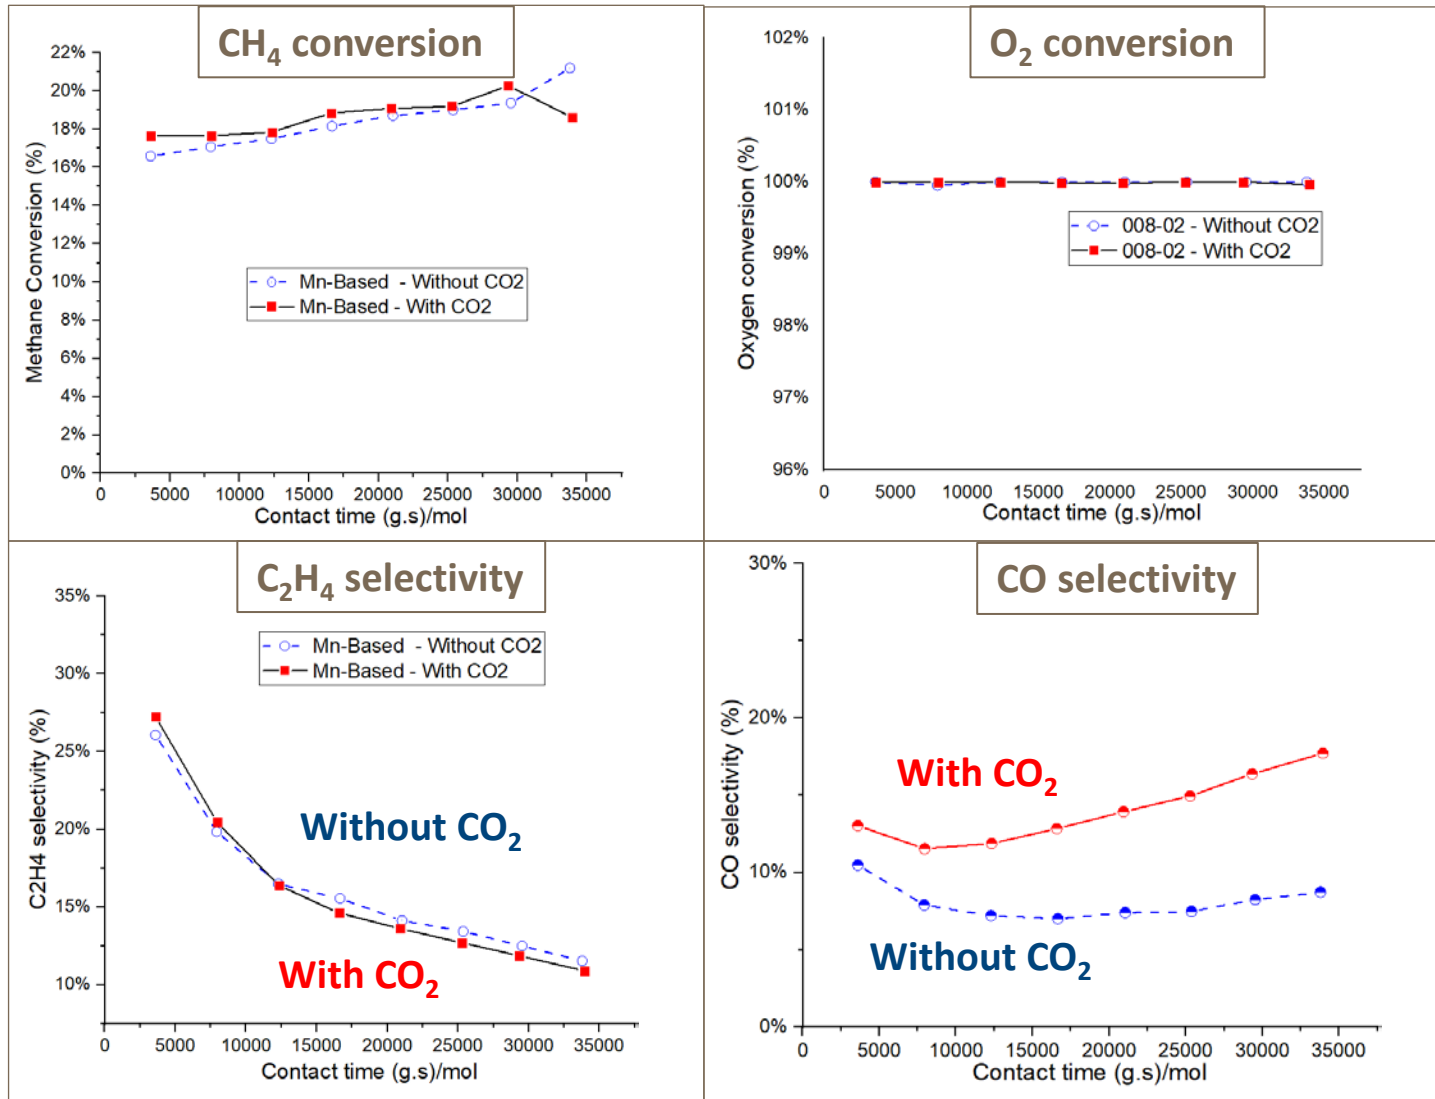

Test on Powders - Mn-based catalyst / Effect of Pressure in the presence of CO₂

- From 1 to 3 bars: x3 activity
- Higher CO selectivity with pressure increase
- Higher pressure (>= 6 bars) do not seem adequate for the OCoM (C₂H₄ selectivity decrease)

Test on supported catalyst

Test on supported catalyst / Effect of CO₂ on Mn-Shaped

CO₂ influence

No negative impact on C₂H₄ productivity

Slight increase of CO selectivity

Higher concentration of CO₂ (up to 40%) were tested with no catalyst deactivation

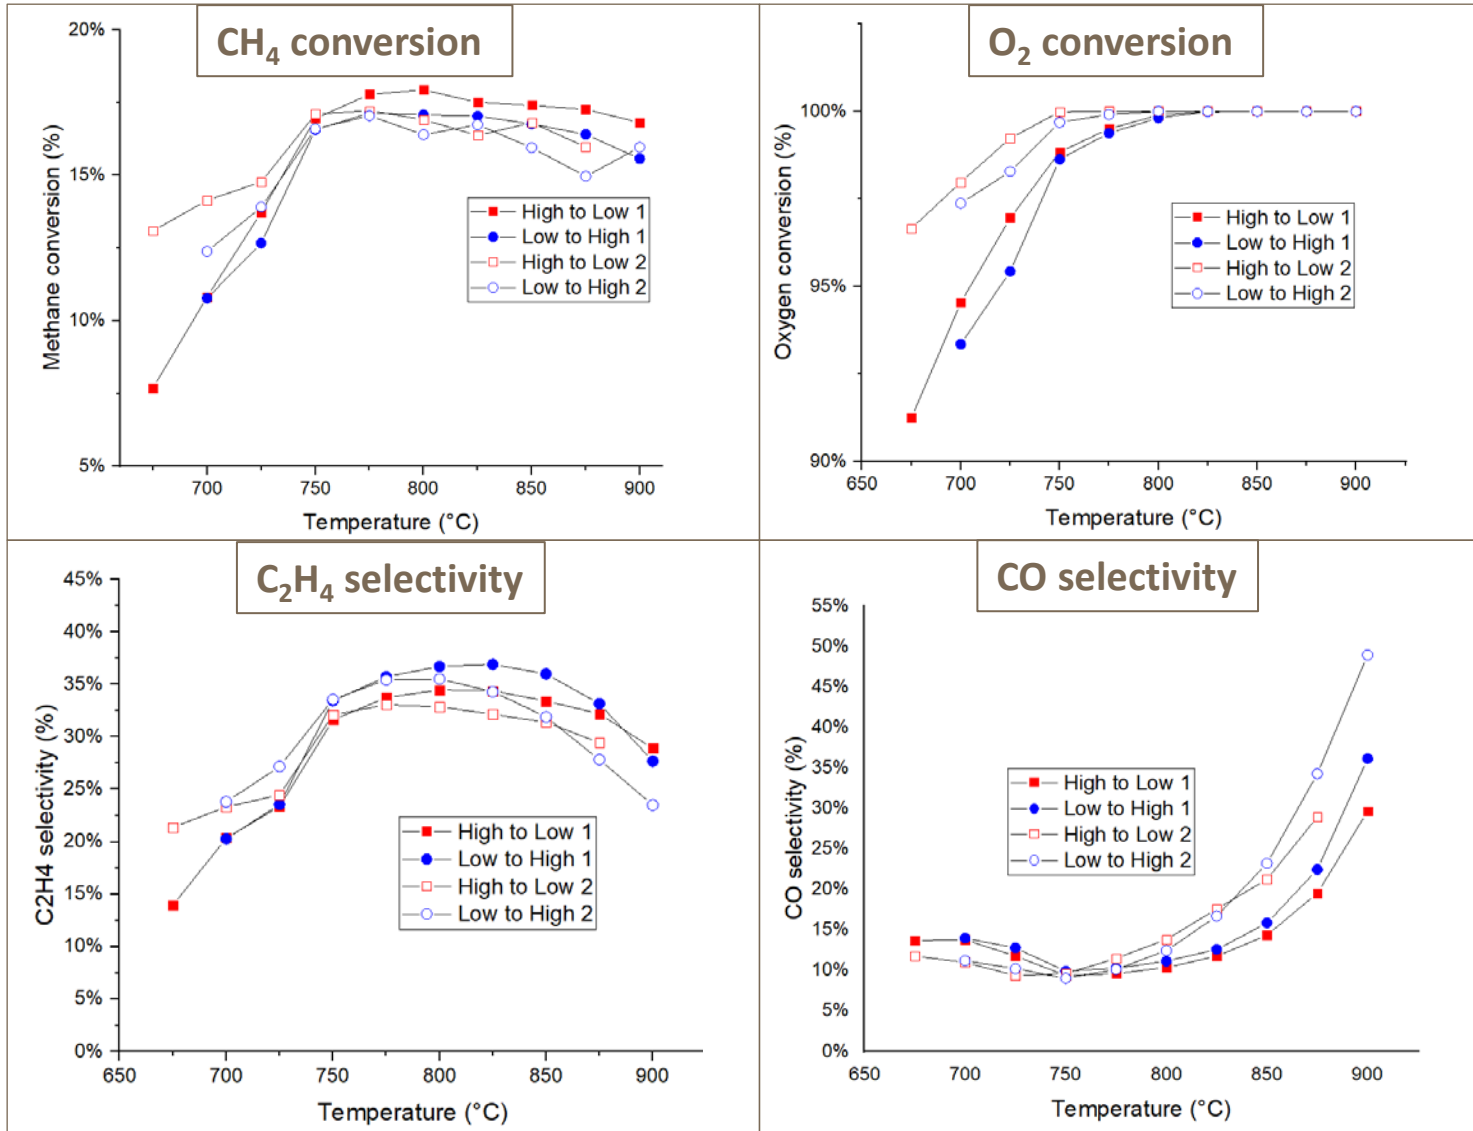

Test on Shaped catalyst / Effect of Temperature on Mn-Shaped

- Temperature influence on **Mn-Shaped**

- Wide temperature range (900°C- 675°C)
- 3 bars with 10%vol of CO₂
- Test over 4 days

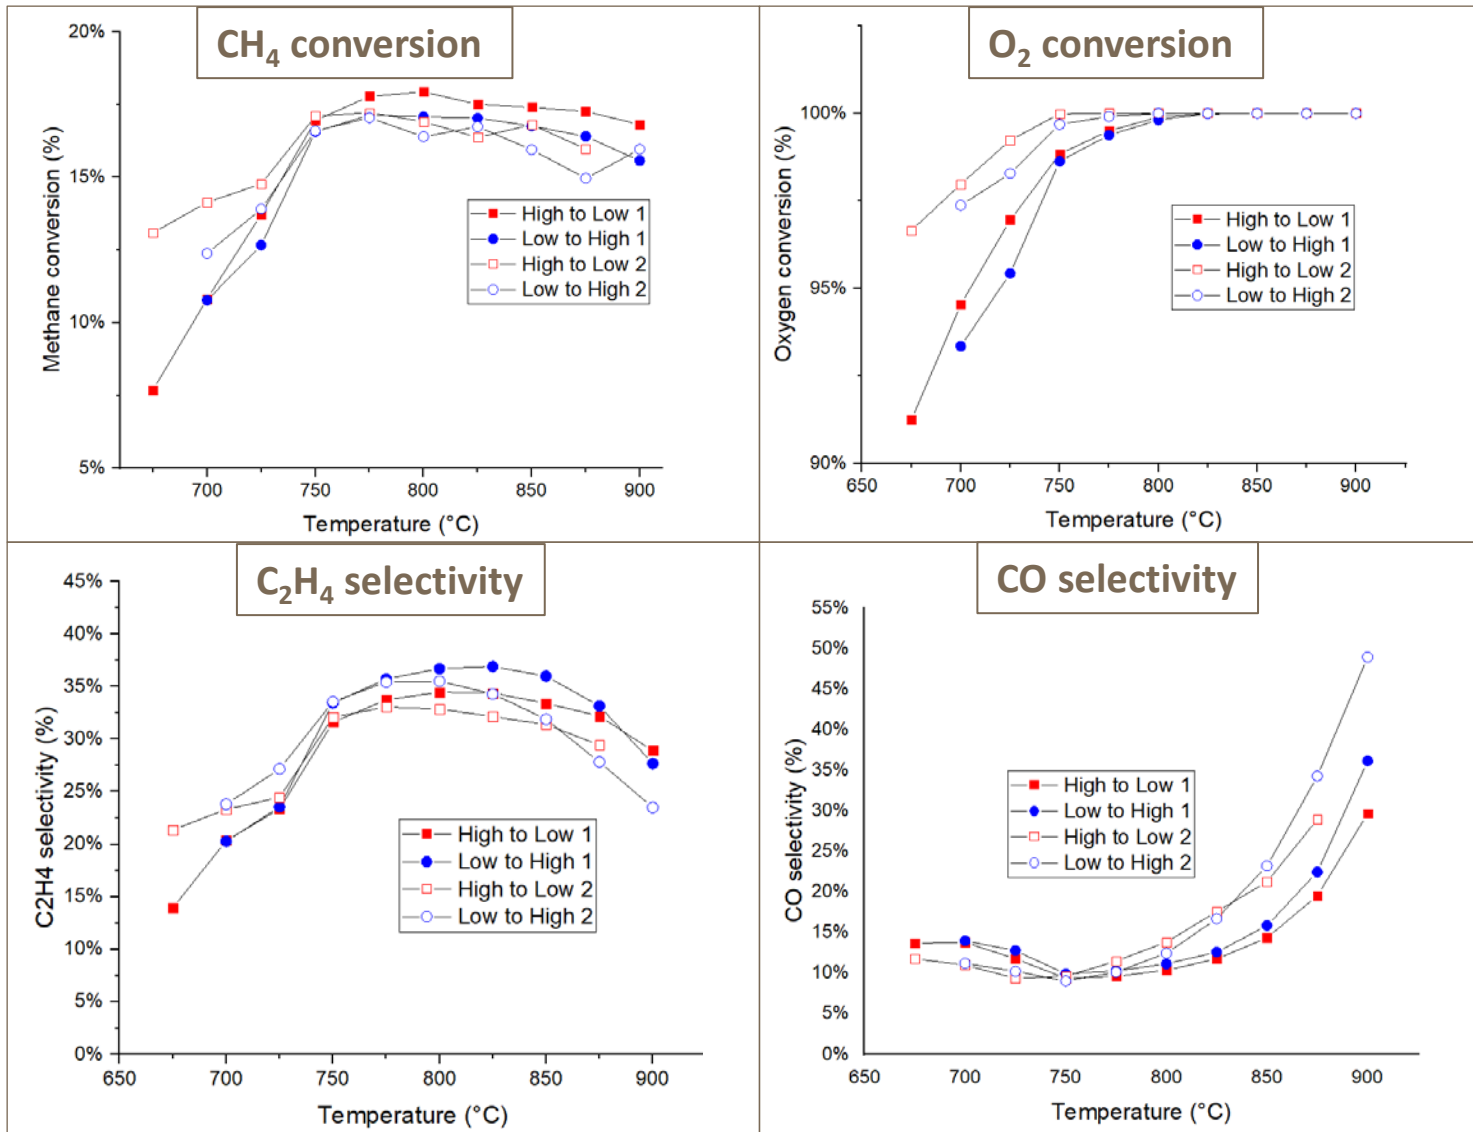

Test on Shaped catalyst/ Effect of Temperature on Mn-Shaped

Temperature influence

- ✓ No major loss of selectivity after 4 days with temperature peaks at 900°C
- CO/C₂H₄ ratio can be tuned by operating temperature

Test on Shaped catalyst / Effect of Temperature on Mn-Shaped

Temperature influence

- ✓ No major loss of selectivity after 4 days with temperature peaks at 900°C
- CO/C₂H₄ ratio can be tuned by operating temperature

 **Coke formation in the reactor**

 **Another run between 750-850°C without coke formation**

Conclusions & Perspective

- From powder to supported catalyst
 - A good C₂H₄ and CO selectivity was maintained with the shaping
 - No deactivation through inlet CO₂ composition was noticed (up to 40% inlet concentration)
 - Thermal stability appears to be good for the supported catalyst

- Perspective
 - Scale-up to industrial pilot
 - Long-term stability test
 - Mechanism study, kinetic modeling

Thank you for your attention!
