CINZLDI

Centre for intelligent electricity distribution - to empower the future Smart Grid

> Cybersecurity misuse cases for future distribution grids CINELDI konferansen, 9. April

Marie Moe, Research Manager Cyber security, SINTEF Digital

Misuse cases: Methodology

- Workshop with industry partners
- Misuse cases identified

Misuse case: Injection of false measurement data

- 1. The attacker gains access to an unprotected substation
- 2. The attacker attaches a portable computer to the internal substation network, ensuring all communication has to go via this computer
- 3. The attacker will read all messages from sensors used for state estimation, and modify sensor values to systematically show lower values

Consequences

• Wrong data from enough of the sensors can result in wrong decisions that harm the power delivery.

• Economic consequences?

Misuse case: Malicious software update

- 1. A vendor uses a website to distribute software updates to its customers.
- 2. This website has vulnerabilities that allows an attacker to upload files
- 3. The attacker creates trojanized versions of several firmware updates to the vendor's equipment, and uploads these to the vendor website with the current date.

Misuse case: Malicious software update

0101100000

001**000110**00

- 4. The DSO update manager discovers that there are new updates available for the vendor's equipment, and downloads the trojanized updates (there is nothing to tell that the updated are malign)
- 5. The update process places malware in the DSO network, and also on the vendor's equipment
- 6. The attacker gets real-time access to the DSO network and the vendor's equipment in that network

Misuse case: Malicious software update Consequences

- If no propagation
 - local outages, increased manual workload and potentially the cost of replacing any affected equipment
- With propagation
 - potentially giving the threat actor control of the whole grid
- Both

14

 fires, personnel injuries, components no longer fulfilling their purpose, and wrongful information being reported to the control centre

Misuse case: Malware in delivered equipment from vendor Insider at supplier:

- 1. Insider is either extorted or have malicious intent
- 2. Insider installs backdoor/malware in equipment that allows remote access
- 3. Use backdoor to gain unauthorized access

Misuse case: Malware in delivered equipment from vendor Test access functionality not removed:

1100001010

0 0 1 0 0 1 0 0 0 0 1 1 0 0 0 0 1 0 1 0 1 0 1 0 0 1 1 0 1 0 0 0 1 0 1 0 0 1 0 0 0 0 1 0 1 0 0 1 0 0 0 0 0 1 0 0 0 0 1 0 1 0 1 0 1 0

10010000110

01000100010

10100100011

- Test account and/or debug ports not removed before equipment is delivered to DSO, by intent (insider) or neglect
- 2. Open backdoor into the system might be exploited to deliver malware, either by targeted attack or «drive by exploit»

Misuse case: Malware in delivered equipment from vendor Equipment infected at the supplier:

1100001010

00010010000

00010010000

0 0 1 0 0 1 0 0 0 0 1 1 0 0 0 0 1 0 1 0 1 0 1 0 0 1 1 0 1 0 0 0 1 0 1 0 0 1 0 0 0 0 1 0 1 0 0 1 0 0 0 0 0 1 0 0 0 0 1 0 1 0 1 0 1 0

00100001001 10001100001 10001001110 0010001101

000011010000010011010010000110100

00100100001 01000001101 10000100110

010000

- 1. Malware at the supplier (e.g. in test network) infects the equipment before it is delivered to the DSO
- 2. Malware not detected before the equipment gets installed at DSO

Misuse case: Malware in delivered equipment from vendor Infected equipment moved from one facility to another:

21100001010

00100100001

00110110011 01001000011 00001010110

10010000110

01000100010

- 1. Equipment (e.g. laptop used for software patching) gets infected with malware
- 2. When plugged into environment that is lacking virus detection (or advanced malware) the infection spreads

CINØLDI

Misuse case: Malware in delivered equipment from vendor Vendor that cannot be trusted:

01100001010

00010010000

0 0 1 0 0 1 0 0 0 0 1 1 0 0 0 0 1 0 1 0 1 0 1 1 0 0 1 1 0 1 1 0 0 1 1 0 1 0 0 1 0 0 0 0 1 1 0 0 0 0 1 0 1 0 1 1 0

00001101000

10000110100

1001000011000010101100

0 1 0 0 0 1 0 0 0 1 0 1 0 1 0 0 0 0 1 0 0 0 1 0 1 0 0 1 0 0 0 1 0 0 0 0 0 0 1 0 0 0 1 0 0 0 1 0 1 0 0 0 0 0 1 1 0 0 1 0 0 0 0 1 0 0 0 0 0 1 0 1 0 0 0 0 0 0

- 1. The vendor implements a backdoor in the equipment on purpose (nation state sponsored attack)
- 2. Vendor might share information about how to access the backdoor with their allies

Consequences of malware delivered in equipment

- Risks of unauthorized access to control systems, information gathering attacks or sabotage (targeted attacks)
- Malware might effect production, safety systems and even cause physical harm
- Non-targeted malware might cause unexpected network problems or equipment malfunction
- Vendor trust and reputation will be effected

Thank you!
