01 Objective

Analyze the power system flexibility to achieve higher shares of wind energy integration

- **Analysis of the Generation-side flexibility of the O&G platform** is the objective of this paper.
- Since, flexibility of the power system is the **ability to accommodate any variation** in the load-generation balance, while maintaining the satisfactory level of performance at any time scale.

02 Methodology

Modified PyPSA Model:
Takes into account the efficiency curve of the generators instead of the constant efficiency value.

03 Simulation

Power System Size

Open-cycle Gas Turbine
= 4 x 33MW

IEA Offshore Wind Turbine
= 4 x 15MW

Case Studies

Conventional Constraints

1. Average Dispatch of Conventional Constraints - 68MW Average Load

2. Average Dispatch of Conventional Constraints - 34MW Average Load

Flexible Constraints

3. Average Dispatch of Flexible Constraints - 68MW Average Load

4. Average Dispatch of Flexible Constraints - 34MW Average Load

Input Data

Load Profiles of O&G Platform

Efficiency Curve LM2500

15MW IEA Wind Turbine

Constant Wind Speed Profile
9.6 m/sec

04 Results

Average dispatches of turbines in different systems

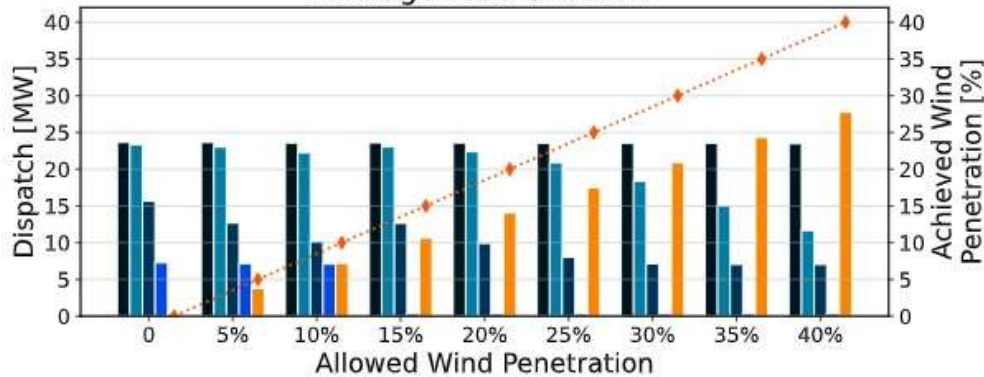

Conventional constraints
Average Load of 68MW

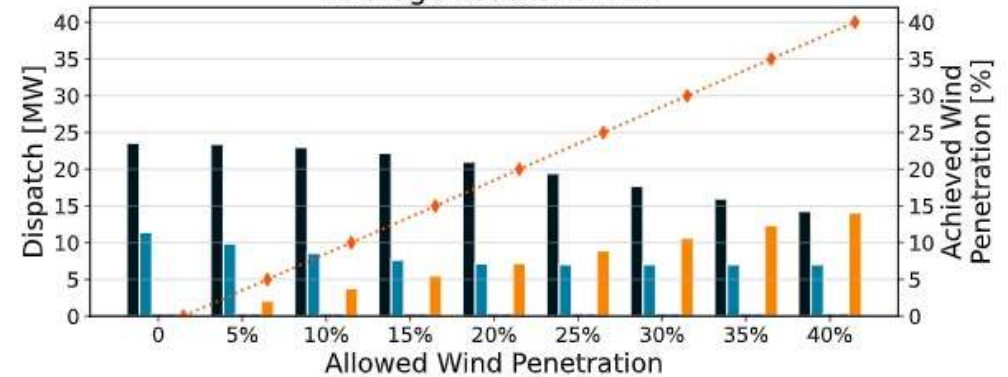

Conventional constraints
Average Load of 34MW

Flexible constraints
Average Load of 68MW

Flexible constraints
Average Load of 34MW

Gas Turbine 1
 Gas Turbine 2
 Gas Turbine 3
 Gas Turbine 4
 Wind Turbine
 Achieved wind penetration

04 Results

Average Fuel Consumption Reduction at Different Wind Penetration Levels

Conventional constraints
Average Load of 68MW

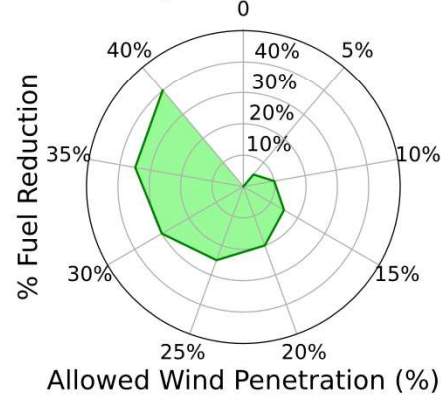

Conventional constraints
Average Load of 34MW

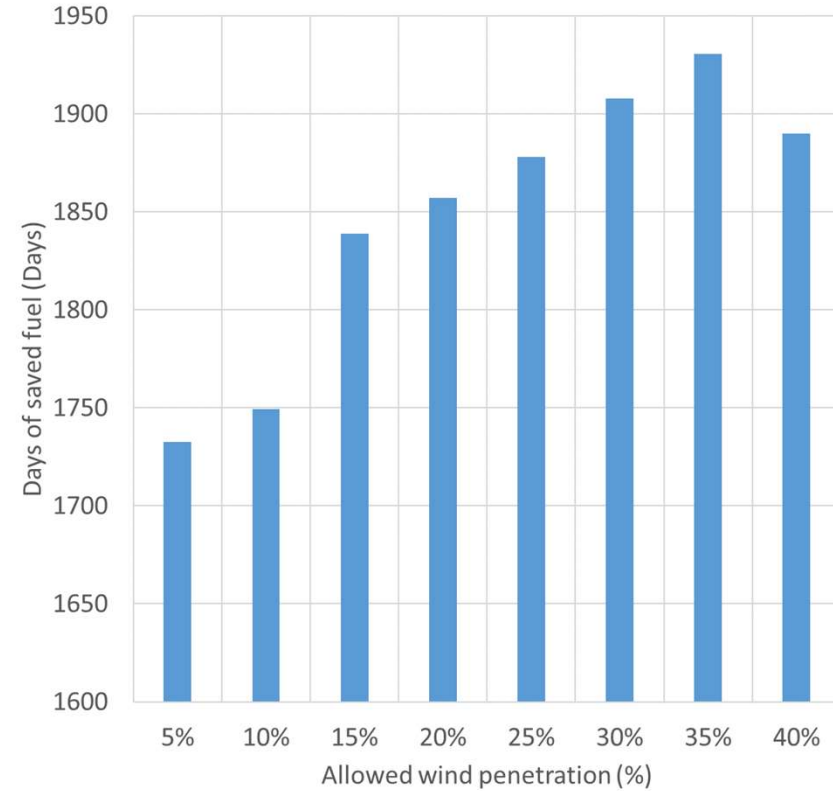

Flexible constraints
Average Load of 68MW

Flexible constraints
Average Load of 34MW

Days of Fuel Saved for Different Levels of Wind Penetration
(Lifetime of 25 years)

05 Conclusion

- In our analysis, the flexibility increment of the gas turbines can slightly increase the shares of wind energy.
- The increment in wind energy penetration reduces:
 - The fuel consumption and hence CO₂ Emissions.
