

# Getting started with ALSVID-UQ <sup>1</sup>

eVITA Winter School 2015

Kjetil Olsen Lye

January 18, 2015

---

<sup>1</sup><http://www.sam.math.ethz.ch/alsvid-uq/>

The material covered in this presentation is also covered with greater detail at the homepage of ALSVID-UQ:

<http://www.sam.math.ethz.ch/alsvid-uq/>

The slides will be available online

# Prerequisites

[Ubuntu package names in blue]

- ▶ [python2.7]: Python 2.5 or greater ([www.python.org](http://www.python.org))
- ▶ [g++]: GCC C++ like compiler
- ▶ [python-numpy]: numpy [**plots**] ([www.numpy.org](http://www.numpy.org))
- ▶ [python-matplotlib] matplotlib [**plots**] ([matplotlib.org](http://matplotlib.org))
- ▶ [mayavi2] mayavi [**3D-plots**]  
([code.enthought.com/projects/mayavi/](http://code.enthought.com/projects/mayavi/))
- ▶ [openmpi-bin] MPI [**multinode**] ([www.open-mpi.org](http://www.open-mpi.org))

To install these on Ubuntu, issue the command

```
sudo apt-get install python2.7 g++ mayavi2 \  
python-numpy python-matplotlib openmpi-bin
```

## Downloading and installing

- ▶ Latest version available at <http://www.sam.math.ethz.ch/alsvid-ug/>
- ▶ Direct download link: <http://www.sam.math.ethz.ch/alsvid-ug/3311/alsvid-ug-3.0.tar.gz>
- ▶ Installation: Untar to suitable destination
- ▶ Installation: Copy `alsvid-ug-3.0/configs/local-mayavi_visualization.py` to `alsvid-ug-3.0/local_visualization.py`

Download and installation command (Linux):

```
wget http://www.sam.math.ethz.ch/alsvid-ug/3311/alsvid-ug\
-3.0.tar.gz
tar xvf alsvid-ug-3.0.tar.gz
cd alsvid-ug-3.0
cp configs/local-mayavi_visualization.py \
local_visualization.py
```

## Running ALSVID-UQ: Interactive mode

- ▶ Change directory to `alsvid-uq-3.0/run`  
`cd alsvid-uq-3.0/run`
- ▶ Start ALSVID-UQ in interactive mode (gives overview of options)  
`python ../make.py --ask`
- ▶ Each presented option has a sane default value

Sample output:

```
python ../make.py --ask
```

Major Options:

Select equation:

```
bl          "Buckley-Leverett (scalar nonlinear conservation law)"
burgers    "Burgers' (scalar nonlinear conservation law)"
euler      "Euler (Euler equations of gas dynamics)"
linadv     "Linear Advection (scalar linear conservation law)"
mhd        "MHD (Magneto-HydroDynamics equations)"
sw         "Shallow Water Equations"
wave       "Wave (Wave equation)"
equation: [mhd]
```

# Running ALSVID-UQ: Non-interactive

Can run with all options specified on command line

```
python ../make.py equation:burgers model:sine space:o2eno
```

Short explanation:

**equation** equation to solve

**model** initial value

**space** space solver

# Plotting

To plot results, start

```
python -i ../plot.py
```

Inside the Python shell,  
type:

```
>>> r.plot(br.U)
```

Explanation:

`r` the data from the run

`br` Burgers' specific

OPTS: balancer:static, equation:burgers, flux:det, model:sine, multi:single,  
rng:well512a, solver:hll, space:o2weno, stats:mean-var

VARS:

INFO: cores: 1, runtime: 0:00:00

## Saving more outputs

- ▶ Default: Only last timestep saved
- ▶ Can add more with NSAVES option:  

```
python ../make.py ... NSAVES=10
```
- ▶ Can plot specific timestep with  

```
>>> r.plot(br.U, ts=3)
```

## Bonus slide: Creating custom model

It is relatively straightforward to create custom model

1. Create a new file in `src` with name

`model-<equation>_<model name>.cpp`

eg.

`model-burgers_geilo.cpp`

2. Fill in the newly created file with

```
#include "equation.h"  
#include "chaos.h"
```

```
///::title:: <your title>  
///::vars:: NX=<nx> MAXT=<maxt>  
///::consts:: MAXX=<maxx>  
///::bc:: {NEUMANN, PERIODIC, MIXED}
```

```
void initial_data (PrimitiveVars &v,  
    real x, real y, real z) {  
    v.u = <value>; // Any C++ is allowed  
}
```

## Bonus slide: Creating custom model

A concrete example: model-burgers\_geilo.cpp

```
#include "equation.h"  
#include "chaos.h"
```

```
///::title:: Sine wave created at Geilo Winter School 2015  
///::vars:: NX=512 MAXT=4  
///::consts:: MAXX=2  
///::bc:: NEUMANN
```

```
void initial_data (PrimitiveVars &v,  
    real x, real y, real z) {  
    v.u = sin(pi*x);  
}
```

Run with

```
python ../make.py equation:burgers model:geilo space:o2eno
```
