

# 3D Gamma Tomography Tool cutting edge technology for hydrate plug detection

**3rd Trondheim Gas Technology Conference,  
4th-5th June 2014**

**Keijo Kinnari, Senior Specialist, Technology Excellence, Statoil**

**Xiaoyun Li, Specialist Principal Researcher, Statoil**

**Lee Robins, Head of Subsea Services, Tracerco**

# Outline

- Introduction
- Flow assurance challenges and needs
- Initial Statoil and Tracerco cooperation on developing/testing detection tools
- Examples of field tests
- Discovery™ - Subsea Pipeline Visualisation
- Introduction to the technology
- Trials and scan images
- Summary and Conclusion

# Introduction

---

- Hydrate restrictions in production systems
- No reliable detection tools, especially for subsea use
- Needs for high accuracy detection tools
- Cooperation between Statoil and Tracerco over last 10 years
  - To develop detection technology
  - Primary goal was FA applications
  - Application areas have expanded

# Flow Assurance challenges

- Plug location
- Plug characteristics
  - Liquid pockets, wax depositions, hydrate restrictions, scale etc.?
- Information important for
  - Safety considerations
  - Evaluation of remediation solutions

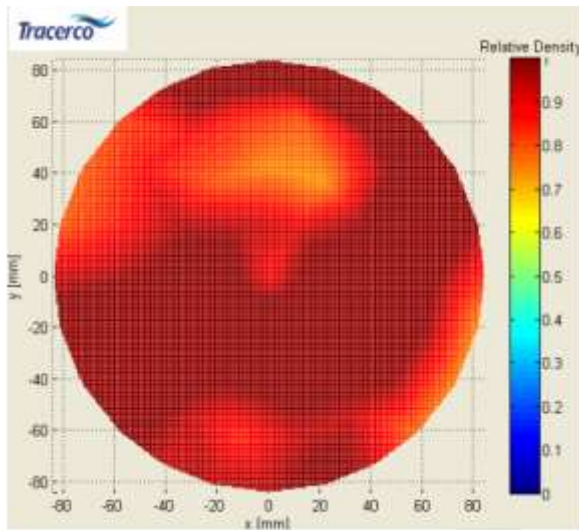

# Statoil's Flow Assurance Pilot

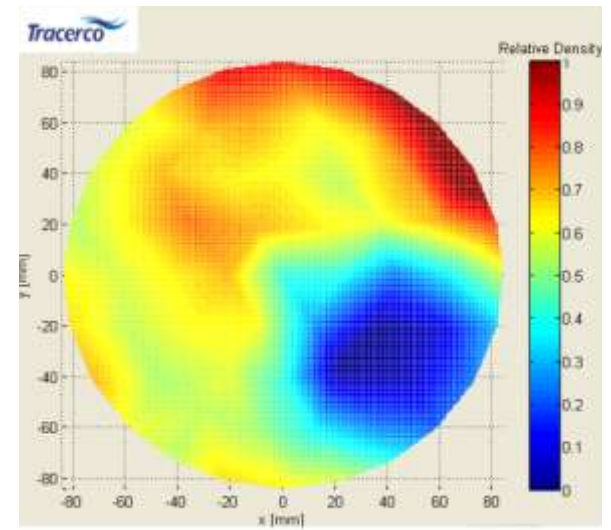

# Statoil's Flow Assurance Pilot Plant

Tomography technique used during hydrate detection trials

Tomography map with liquid filled pipe section

Tomography map after draining

# Tomography applications

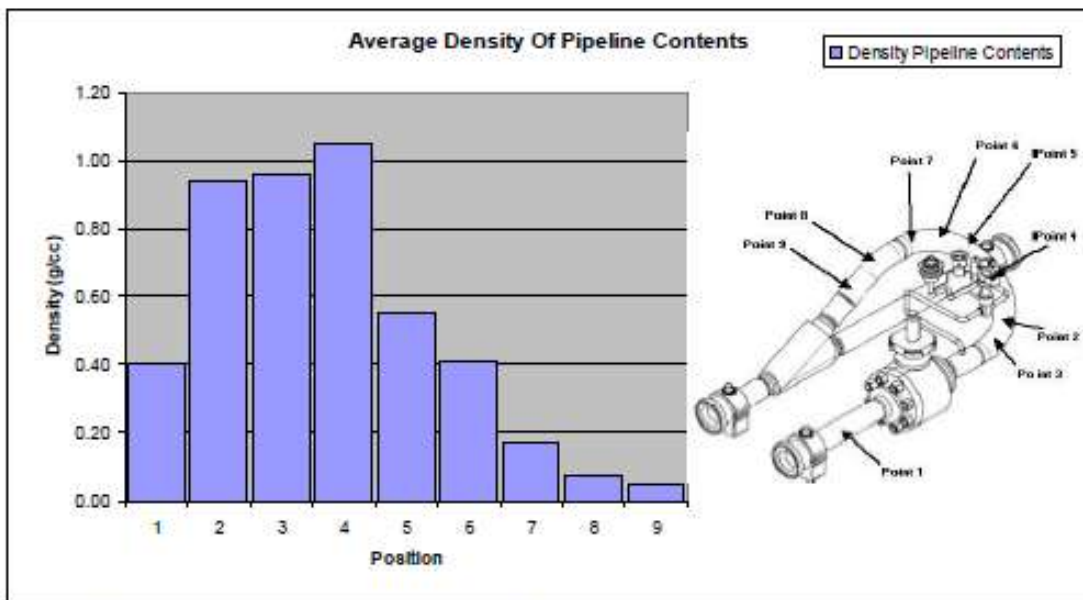

## Topside field measurements

Hydrate Survey Statoil Heimdal  
Valve Closed  
(Pressure approx 104 bar)  
Position 9-22 (16" Line)

# Single gamma applications

## Subsea field trial

Graph 6: Density measurements on the "Wye" riserbase

Picture 1: Tracerco Diagnostics Subsea Pipe Scan equipment

**Discovery**  
*The technology*

# Discovery Pipeline Visualisation

- Tracerco Discovery™ is the world's first Subsea CT Scanner, a revolutionary non-intrusive technology for inspection of subsea pipelines.
- It is specifically targeted for the inspection of **unpiggable, coated pipelines**

# Discovery Principle

Same principle as medical CAT scanner

- Reconstructs image of a target from a series of projections
- One gamma radiation source and a large number of detectors

The same concept has been taken from the medical field to design, implement and deploy a scanner for subsea pipelines

**Discovery**  
*Initial Prototype Results*

# Initial Lab Prototype Results

10-inch Pipe, 20mm wt, 50mm PU coating

# Pipe-in-pipe Systems

Assess integrity of inner and outer pipes

# Caissons and Pipe Bundles

Assess integrity of internal flowlines as well as the outer pipe

Oil Riser

Gas Riser

# Discovery

## *The Instrument*

# Discovery – specification overview

- Completely non intrusive
  - No need to remove coating
  - No need to stop production
- Wide range of pipes
  - 6 to 27 inch.
  - Integrity and Flow Assurance
  - Pipe-in-pipe and caissons
- 10000 ft / ~3000m Depth
- X/Y resolution close to 1mm
- Real-time Data Acquisition on the vessel
  - Images continuously updated **every 20-30 seconds**

# Discovery – specification overview

- Crawler
  - Instrument automatically advances on the pipe
- Scanning speed
  - ~2-3 ft/h for low resolution
  - ~0.5 ft/h for high resolution

# Discovery

## *Underwater Trials*

# First Subsea Trial - Bergen, April 2013

# 2nd Subsea Trial – Scotland, 08/13

# Customer Trial Results

- Test pieces supplied by customers, for proof of capability prior to offshore inspection project

**Tracerco Discovery**  
*Customer Trial Results – Flow Assurance*

# Flow Assurance Trial 1

20-inch Pipe, 22mm wt, with brick, thermalite block, 2 sand bags, half filled with water

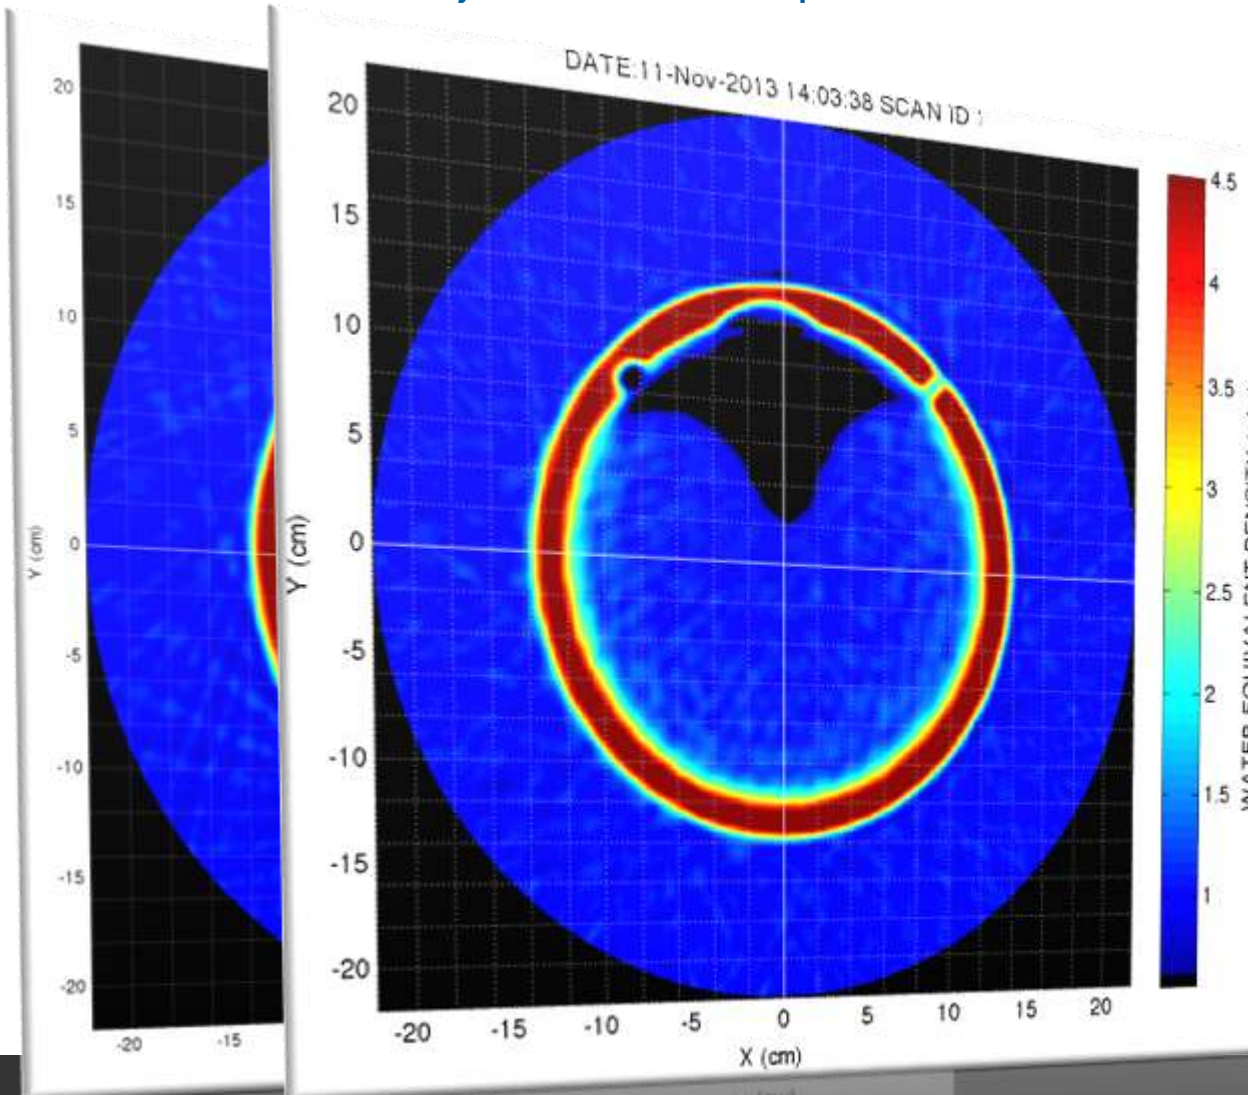

Feature	Description	Dimensional Information
1	Known feature	Object of size 100mm wide x 50mm high, density ~2.4g/cc
2	Known feature	Object of size 95mm wide x 210mm high, density ~0.9g/cc
3	Known feature	Freeform object of approx. size 100mm x 90mm high, density ~1.9g/cc
4	Known feature	Freeform object of approx. size 100mm x 90mm high, density ~1.9g/cc
5	Known feature	Fluid filled to approx. 50% of volume, density ~1g/cc
6	Unknown feature	Gas pocket of approx. size 70mm wide x 35mm high

# Flow Assurance Trial 2

8-inch water injection line with plastic liner

- 273mm OD, 15.9mm WT
- 10mm internal plastic lining
- Manufactured blister to simulate damage

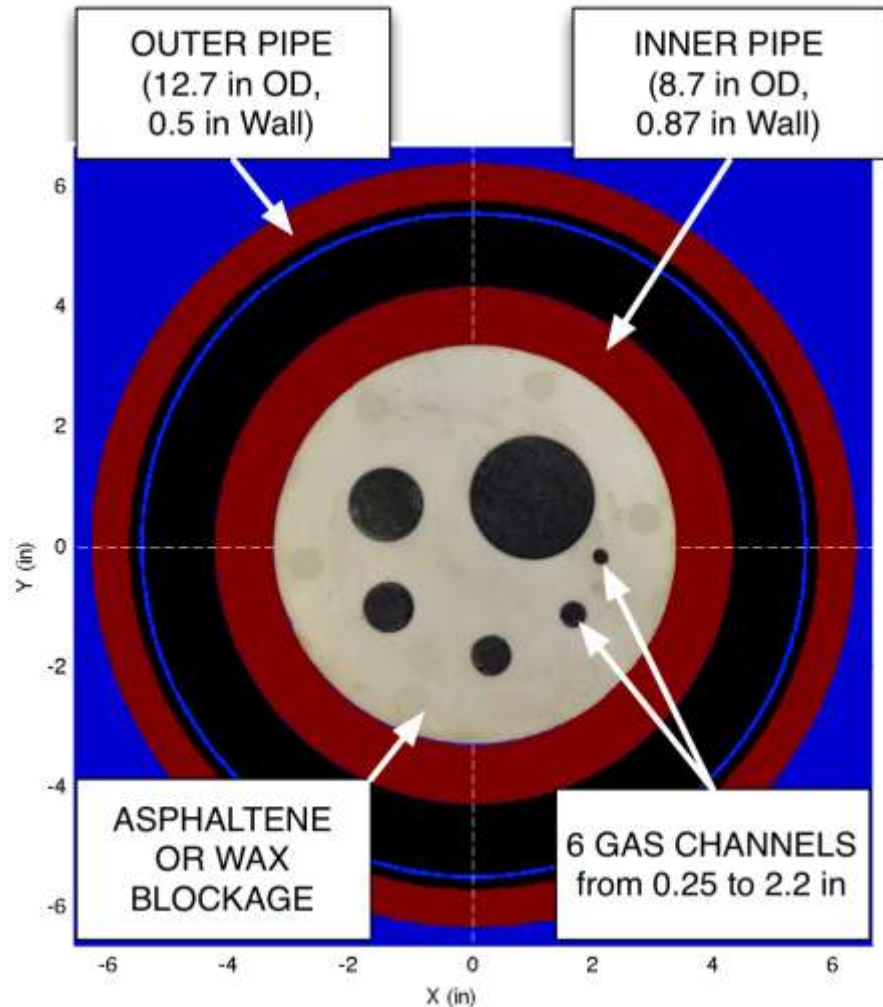

# Flow Assurance Trial 3

**TEST** Detect small gas channel openings in blocked pipelines

**WHY** Assess possibility of gas communication between different sections

**MODEL**

- 12 inch Pipe-in-Pipe
- Blockage and gas as density-equivalent plastic. Then inserted in the pipe and scanned

# Trial 3 – 30 seconds (1 lap)

Most channels detected **after just 1 lap!**

MODEL

RECONSTRUCTION

# Trial 3 – 1 minute (2 laps)

Getting Sharper. Now all channels are visible.

MODEL

RECONSTRUCTION

# Trial 3 – 5 minutes (10 laps)

Getting Sharper. All channels well visible.

MODEL

RECONSTRUCTION

# Trial 3 – 12.5 minutes (25 laps)

All channels completely detected.

MODEL

RECONSTRUCTION

# Flow Assurance Trial 4

**TEST**     **Detecting gas pressure differences in blocked pipelines channels**

**WHY**     Assess gas communication (HP/LP) between sections of pipeline

- MODEL**
- Same Pipe-in-Pipe
  - Blockage and as density-equivalent plastic to asphaltene or wax.
  - HP/LP gas as density-equivalent foam (0.1/0.2 g/cc)

HIGH PRESS.  
GAS ~0.2 g/cc

LOW  
PRESS  
GAS ~0.1  
g/cc

# Trial 4 – 12.5minutes (25 laps)

Successful detection of gas density differences in channels.

MODEL

RECONSTRUCTION

0.1 g/cc

**Tracerco Discovery**  
*Customer Trial Results – Pipeline Integrity*

# Integrity Trial 1

**TEST**      **Detect wall loss on the inner walls of pipelines**

**WHY**

- Assess safety margins
- Extend service life

**MODEL**

- 20 inch pipe, ~20mm wall
- Several defect profiles machined at different axial positions in the pipe

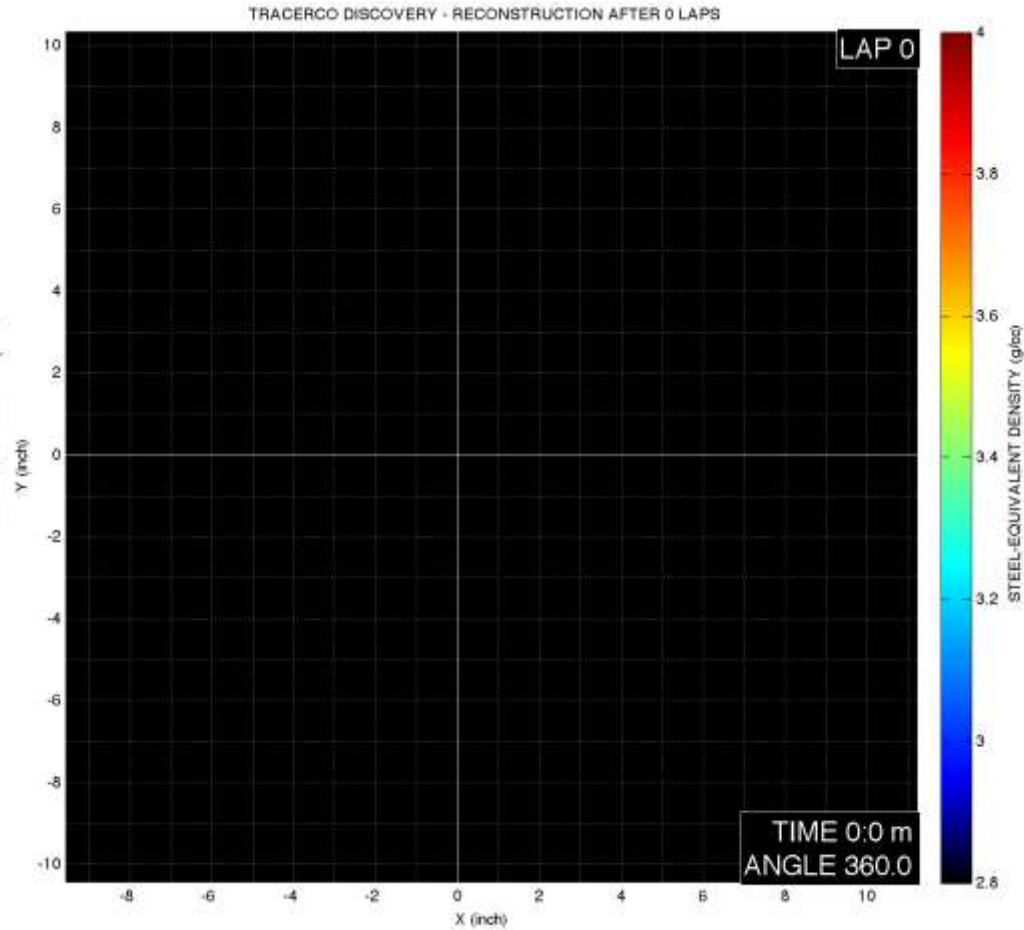

# Integrity Trial 1

6+1 localized defects and 2 scallops to model wall loss

DRAWINGS

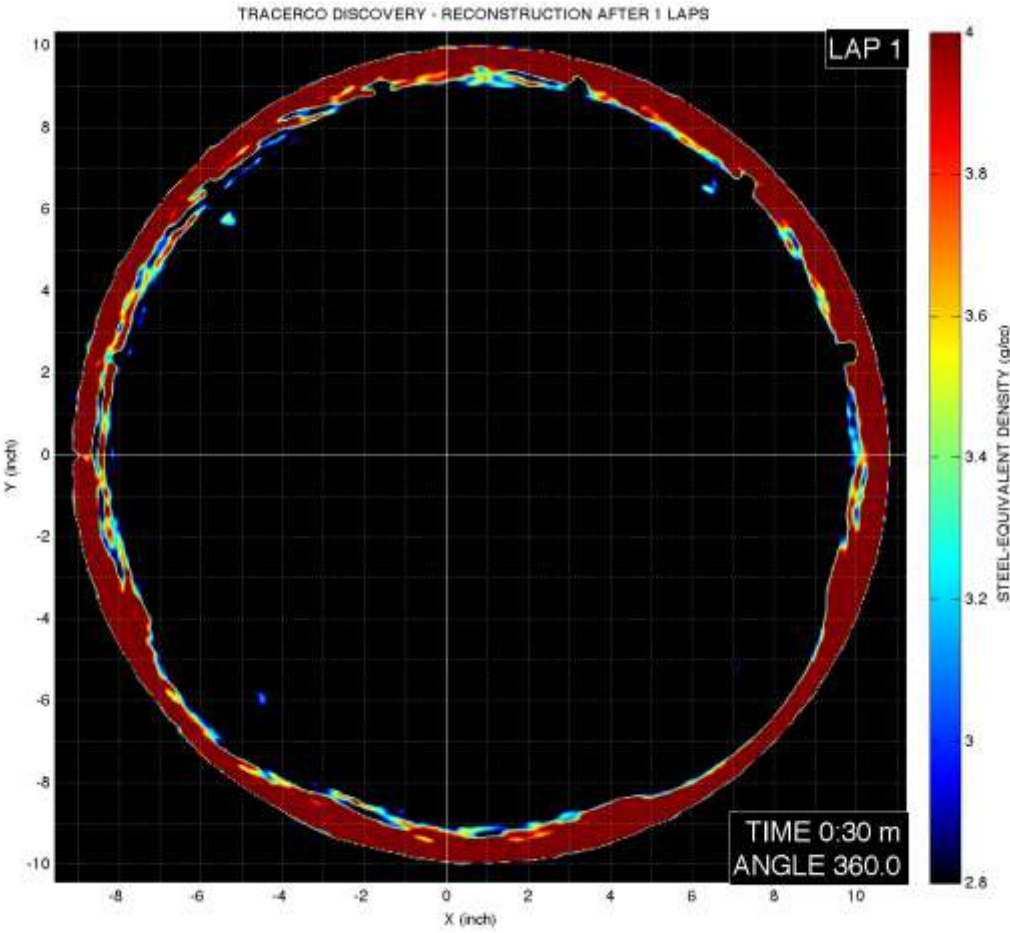

RECONSTRUCTION

# Trial 1 – 30 seconds (1 lap)

Early detection of most defects and scallops in **30 seconds**.

DRAWINGS

RECONSTRUCTION

# Trial 1 – 5 minutes (10 laps)

Image getting sharper. All defects clearly visible.

DRAWINGS

RECONSTRUCTION

# Trial 1 – 20 minutes (40 laps)

High resolution image. All defects visible and quantifiable.

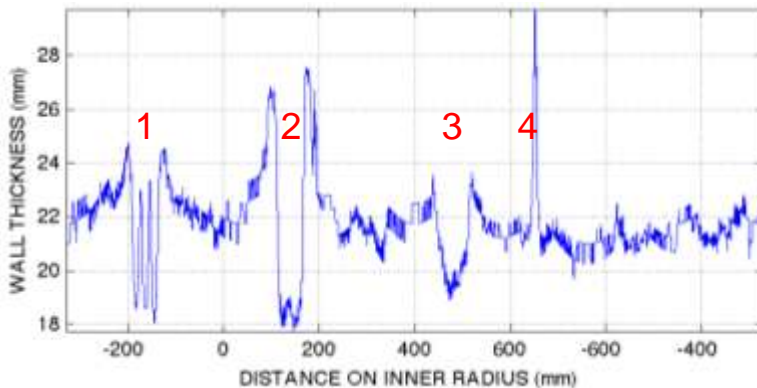

DRAWINGS

RECONSTRUCTION

# Integrity Trial 2

'Blind test' with unknown defects in a 20-inch coated pipeline

# Integrity Trial 3

**TEST** Detect voids and broken strands in flexible risers

**WHY**

- Assess safety margins
- Extend service life

**MODEL**

- 12-inch flexible riser
- 1 strand segment was removed from the outer tensile armor.

# Trial 3 – 30 seconds (1 lap)

Indication of broken strand at the first lap (30 seconds).

MODEL

RECONSTRUCTION

# Test 4 – 12.5 minutes (25 laps)

Image getting sharper. More detail on the inner carcass and all other layers.

MODEL

RECONSTRUCTION

# Conclusion

- Tracerco and Statoil have cooperated to produce the world's first Subsea CT Scanning device.
- Truly **non intrusive** technology
  - Through coating
  - No need to stop production
- Integrity **and** Flow Assurance
- **Real time** data
- Near mm accuracy
