

Newsletter 2-2015

Introduction

The WoodCFD project is proceeding as planned, focusing on achieving the overall objective, which is development of clean and efficient wood stoves through improved batch combustion models and CFD modelling approaches through:

- Model development: improved transient wood log and gas release models, transient heat transfer and storage models, reduced kinetics models (NOx and soot), and transient models and approaches for heat distribution in the building; and verification of these
- Simulations: transient and stationary CFD simulations of wood stoves, and room and building integration simulations; and verification of these

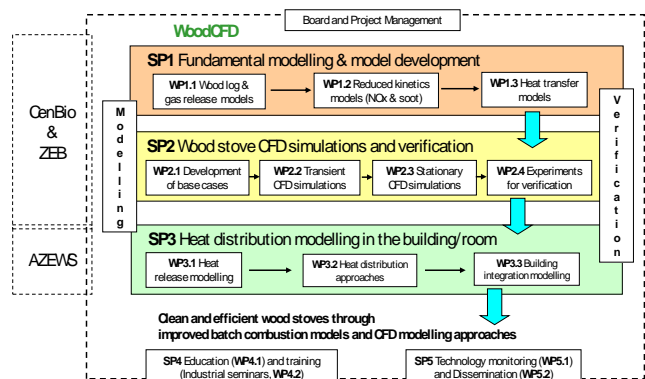

The sub-objectives are:

- Develop improved sub models to be included in the CFD simulations
- Develop a numerical tool that is suitable to study concept improvements for wood stoves and to recommend new improved concepts with respect to high energy efficiency and low emissions based on simulation results
- Develop improved transient heat distribution models - giving reliable prediction of the effect of various heat transfer concepts in buildings and providing design guidelines for optimum wood stoves for tomorrows (energy efficient) buildings
- Education of highly skilled candidates within this area and training of industry partners
- Monitoring of activities and state-of-the-art within this area and dissemination of knowledge to the industry partners, and other interested parties when applicable

The anticipated results of the project are clean and efficient wood stoves through improved batch

combustion models and CFD modelling approaches. Improved models and modelling approaches, in combination with targeted experiments, are keys in the development of future's downscaled clean burning and energy efficient wood stoves. This will have a potentially huge impact on the most important bioenergy value chain in Norway today, targeting key bottlenecks in the value chain, i.e. reducing today's still relatively high emissions from wood stoves and improving their energy efficiency, especially in low load wood stoves, as well as ensuring optimum room and building integration.

The Work Breakdown Structure of WoodCFD is:

WoodCFD will run for four years (2015-2018) and has a total budget of 17.5 million NOK which is 80% financed by the [Research Council of Norway](#) through the [ENERGIX](#) program and 20% financed by the industrial partners [Jøtul AS](#), [Dovre AS](#), [Norsk Kleber AS](#), [Morsø Jernstøberi A/S](#).

Progress in 2015

In 2015 the scientific focus has been on initial studies and establishment of sub-models for use in transient CFD simulations, as well as modelling of heat transfer in stoves and analysis of heat distribution to other rooms in a building. The work with the sub-models, also for stationary CFD simulations, continues in 2016.

How to operate your wood stove

A new firing season has started, and each year the same subject is coming up in the media, i.e. how to operate your wood stove in the best way. We therefore here points towards selected popular science articles and web articles that provide information that might make even you a better wood stove operator. Recommended articles are:

[Her er "vedfyringens ABC"](#)

[Hvordan oppnår du optimal trekk og riktig fyring i vedovnen?](#)

[Sjekk om du bør bytte vedovn](#)

[Sjekk om du bør ha feier på besøk](#)

[Disse tingene må du huske å gjøre før du fyrer i peisen](#)

[Tre tips gir skikkelig fyr i peisen](#)

These articles are in Norwegian, but good advices in English can be found in the [Guidebook Effective and environmentally friendly firing of firewood](#).

In a nutshell:

1. Plain and simple, as the operator and control system, you significantly influence the performance of your wood stove, with respect to both emissions and efficiency. Become a more educated wood stove user, and by that also contribute to reduced environmental impact from your stove.

2. If you have an old wood stove, pre 1998, replacing this with a new one will be very wise both from an emissions and efficiency point of view. Why? Because the new wood stoves implement measures for improved combustion that do not exist in the old stoves.

Radiation or convection stove?

Many, more or (usually) less qualified, opinions regarding the preferred stove type with respect to optimum heat transfer mode, radiation or convection, exist. WoodCFD has therefore written a small popular science article on this subject. The conclusion is that there is no general preference, and that **a balanced combination of radiation and convection gives the best heat comfort**. See the article attached to this newsletter (in Norwegian).

PhD position filled

The announced PhD position within "Numerical simulations of the transient behavior of wood log decomposition and combustion" has been filled. A number of applications were been received. After

completion of the applicant evaluation process and carrying out interviews, Inge Haberle from Austria was nominated and accepted the PhD position.

Collaboration with ZEB

As in the [StableWood](#) project, the predecessor to WoodCFD, there is an active collaboration with [The Research Centre on Zero Emission Buildings](#) (ZEB).

Other news

IEA Task 32 Biomass Combustion and Co-firing

An [IEA Bioenergy Task 32](#) meeting was arranged in Berlin in connection with the [IEA Bioenergy Conference 2015](#), October 27-29. Final planning of activities for the next triennium (2016-18) was on the agenda. An [Expert workshop on Highly Efficient and Clean Wood Log Stoves](#) was also arranged by Task 32. Also in the new triennium wood stoves will receive significant attention, and a workshop dedicated to wood stoves is planned, as well as a wood stove session on the upcoming [Combustion Generated Nanoparticles conference](#) June 13-16 in Switzerland. For more information about IEA Bioenergy Task 32 activities, see the recent [newsletter](#), and for IEA Bioenergy news, see this recent [newsletter](#).

EERA Bioenergy - Stationary Bioenergy

After arrangement of the EERA Bioenergy - Stationary Bioenergy Sub-Program workshop ECN in the Netherlands June 15-16, where the goal was to align efforts towards joint proposals, to e.g. H2020, within the stationary bioenergy area, the effort now is focused on selection of topics and coordination of efforts to establish joint proposals. For more info on EERA Bioenergy, visit the [website](#), and see the most recent [newsletter](#).

Seminar in Copenhagen: Real-world emissions from residential wood combustion

SINTEF Energy participated in a seminar in Copenhagen December 3, arranged by the University of Aalborg in Copenhagen, where SINTEF had been invited together with several European and not at least Danish woodstove “experts”. The seminar focused on the challenges in determining and minimizing real-world pollutant emissions from residential wood combustion, keeping in mind that test bench results cannot simply be considered representative of actual emissions. The seminar was also intended as a catalyst for idea development and possibly later project development among the participants. The seminar should stimulate networking and participants were encouraged to contribute to discussions. Following the seminar, a blog has been launched, with links to all the [presentations](#).

Further plans for a new competence building project on indoor air quality/stove emissions, administered by

NTNU, will seek collaboration with several of the participating parties.

RHC technology platform

The activity level of the [RHC platform](#) has been limited this year, as new financing solutions have been sought and the originally planned strategy documents have been delivered. However, the activity level is expected to pick up in 2016, see the recent [newsletter](#) for more information.
