**CLIMIT**

**Disclaimer:** This report is the product of the carbon capture, utilization, and storage (CCUS) experts' workshop held in Trondheim, Norway June 19 and 20, 2019. The content of this report reflects the views and opinions of the workshop participants and report authors and does not necessarily reflect those of their respective governments, companies, or academic institutions.

# MISSION INNOVATION

Accelerating the Clean Energy Revolution

## Carbon Capture Innovation Challenge

Report of the Carbon Capture, Utilization and Storage Experts' Workshop

June 19–20, 2019

Trondheim, Norway

**Carbon Capture Challenge co-leads:** [Nelson Mojarro](#), Ministry of Energy, Mexico  
[Tidjani Niass](#), Saudi Aramco, Saudi Arabia  
[Brian Allison](#), Department for Business, Energy & Industrial Strategy (BEIS), UK

**CCUS Experts Workshop:**

Co-chair [Nils A. Røkke](#), SINTEF, Norway  
Co-chair [Brian Allison](#), BEIS, UK

Session chairs:

**Decarbonizing industry sectors**

[Mike Monea](#), CCS Knowledge Centre, Canada

**The role of CCS in enabling clean hydrogen**

[Lars Ingolf Eide](#), Research Council of Norway

**Storage and CO<sub>2</sub> networks**

[Isabelle Czernichowski-Lauriol](#), BRGM, France

**Storage monitoring**

[Katherine Romanak](#), University of Texas, USA

**Going climate positive**

[Niall MacDowell](#), Imperial College London, UK

**CO<sub>2</sub> utilization**

[Paul Bonnetblanc](#), Ministry of Ecological Solidarity Transition, France

## Acknowledgements

We would like to acknowledge the direct financial support to the workshop from Research Council of Norway (RCN), Department for Business, Energy and Industrial Strategy (BEIS) UK, TOTAL, The CLIMIT Programme, Gassnova, and Equinor, The Norwegian CCS Research Centre (NCCS), and SINTEF Energy Research.

In planning and preparing the workshop programme we had several telephone conferences with the Steering Group of the Mission Innovation Challenge CCUS. Your guidance was instrumental and was highly appreciated!

A special thanks goes to the following:

- The Workshop Co-Chairs: Nils A. Røkke (SINTEF, Norway) and Brian Allison (Department for Business, Energy and Industrial Strategy, UK).
- The Session Chairs: Mike Monea (CCS Knowledge Centre, Canada), Lars Ingolf Eide (Research Council of Norway), Isabelle Czernichowski-Lauriol (BRGM France), Katherine Romanak (University of Texas, USA), Niall MacDowell (Imperial College London, UK), and Paul Bonnetblanc (Ministry of Ecological Solidarity Transition, France)
- The Session Secretaries: Stefania Osk Gardarsdottir (SINTEF, Norway), Gerdi Breembroek (Netherlands Enterprise Agency), Peter Zweigel (Equinor, Norway), Tim Dixon (IEAGHG), Nils A. Røkke (SINTEF, Norway) and Aicha El Khamlichi (ADEME, France)
- The Introductory Speakers at the workshop: Monica Garcia (IEAGHG), Sigmund Størset (SINTEF, Norway), Phillip Ringrose (Equinor, Norway), Tip Meckel (Gulf Coast Carbon Center, USA), Niall MacDowell (Imperial College London, UK) and Jaap Vente (TNO, Netherlands)

# Appendix Section

## Appendix 1:

### About the Workshop

The two-day workshop gathered 135 participants and had six different topics:

1. Decarbonizing industry sectors
2. The role of CCS in enabling clean hydrogen
3. Storage and CO<sub>2</sub> networks
4. Storage monitoring
5. Going climate positive
6. CO<sub>2</sub> utilization

After a welcome address by Nils A. Røkke (SINTEF) and a Mission Innovation status report by Brian Allison (BEIS), introductory presentations were given to all topics in a plenum session. The first three topics were discussed in parallel sessions in the evening of June 19 and the morning of June 20, while the last three topics were discussed in parallel sessions on June 20. Results from session discussions were presented in a plenum session as a conclusion of the workshop. The layout of the workshop program is shown below.

#### June 19

1700	<b>Welcome and introduction</b> Program, expectations, follow-up from Houston workshop		
1730	Introductory presentations		
1900	Dinner (buffet-style) (Briefing session for Session Chairs and Secretaries)		
2000	Session 1 Decarbonizing industry sectors	Session 2 The role of CCS in enabling clean hydrogen	Session 3 Storage and CO <sub>2</sub> networks
2100			
2200			

#### June 20

0830	Session 1 Decarbonizing industry sectors	Session 2 The role of CCS in enabling clean hydrogen	Session 3 Storage and CO <sub>2</sub> networks
1000	Session 4 Storage monitoring	Session 5 Going climate positive	Session 6 CO <sub>2</sub> utilization
1200	Lunch		
1245	Session 4 Storage monitoring	Session 5 Going climate positive	Session 6 CO <sub>2</sub> utilization
1415	Reporting session		
1530	Busses leave for airport		

The groups were asked to answer the following questions:

1. Which opportunities are identified from an industrial point of view?
2. How do we most effectively get from research to commercial product?
  - a. What steps are needed?
3. What joint activities could be established to accelerate technology development and implementation?
  - a. How can joint action accelerate deployment?
  - b. Business models: What funding instruments are/could/would be effective?
  - c. Mobilizing national efforts towards international efforts
  - d. Public-private partnership, co-funding, etc.

## Appendix 2:

# Workshop program

## JUNE 19

**17:00 Welcome and introduction** (program, expectations for the workshop)  
Nils A. Røkke, SINTEF and Brian Allison, BEIS UK

**17:10 Status of Challenge #3** (recap of Houston workshop, Houston report, etc.)  
Brian Allison, BEIS UK

**17:30 Introduction to topics (12 minutes each)**  
Session Chair: Brian Allison, BEIS; UK

1. Topic 1: Decarbonizing industry sectors (power, cement, refineries, steel, fertilizers...)
  - Introductory speaker: Monica Garcia, IEAGHG
2. Topic 2: The role of CCS in enabling clean hydrogen
  - Introductory speaker: Sigmund Størset, SINTEF
3. Topic 3: Storage and CO<sub>2</sub>-networks
  - Introductory speaker: Phillip Ringrose, Equinor
4. Topic 4: Storage monitoring
  - Introductory speaker: Tip Meckel, Gulf Coast Carbon Center
5. Topic 5: Going climate positive (biomass, waste to-energy, resources and technology)
  - Introductory speaker: Niall MacDowell, Imperial College London
6. Topic 6: CO<sub>2</sub> Utilization
  - Introductory speaker: Jaap Vente, TNO
  - "Success story" speaker: Mark Summers, Emissions Reduction Alberta (ERA)

**19:00 Dinner (buffet-style)**

Briefing session for Session Chairs and Secretaries (separate room)

**20:00-22:00 Group work over topics 1-3**

Session/Topic 1: Decarbonizing industry sectors (power, cement, refineries, steel, fertilizers...)

Chair: Mike Monea, CCS Knowledge Centre  
Secretary: Stefania Osk Gardarsdottir, SINTEF

Session/Topic 2: The role of CCS in enabling clean hydrogen

Chair: Lars Ingolf Eide, Research Council of Norway  
Secretary: Gerdi Breembroek, Netherlands Enterprise Agency

Session/Topic 3: Storage and CO<sub>2</sub>-networks

Chair: Isabelle Czernichowski-Lauriol, BRGM  
Secretary: Peter Zweigel, Equinor

**JUNE 20**

**08:30-10:00 Group work over topics 1-3 (cont'd)**

(Same Chairs, Secretaries and rooms)

**10:00-12:00 Group work over topics 4-6**

Session/Topic 4: Storage monitoring

Chair: Katherine Romanak, University of Texas

Secretary: Tim Dixon, IEAGHG

Session/Topic 5: Going climate positive

Chair: Niall MacDowell, Imperial College London

Secretary: Nils A. Røkke, SINTEF

Session/Topic 6: Utilization

Chair: Paul Bonnetblanc, Ministry of Ecological Solidarity Transition

Secretary: Aicha El Khamlichi, ADEME

**12:00-12:45 Lunch**

**12:45-14:15 Group work over topics 4-6 (cont'd)**

(Same Chairs, Secretaries and rooms)

**14:15-15:25 Reporting (10 minutes each)**

(To be conducted by the *Session Chair, Session Secretary and Introductory Speaker*)

- Topic 1: Monica Garcia, Mike Monea, Stefania Osk Gardarsdottir
- Topic 2: Lars Ingolf Eide, Gerdi Breembroek
- Topic 3: Phillip Ringrose, Isabelle Czernichowski-Lauriol, Peter Zweigel
- Topic 4: Tip Meckel, Katherine Romanak, Tim Dixon
- Topic 5: Niall Mac Dowell, Nils A. Røkke
- Topic 6: Jaap Vente, Paul Bonnetblanc, Aicha El Khamlichi

**15:25 Summary and conclusion**

Nils A. Røkke and Brian Allison

## Session Topics, Chairs, Secretaries, and Introductory Speakers

### Topic 1: Decarbonizing industry sectors

- Chair: Mike Monea, CCS Knowledge Centre
- Secretary: Stefania Osk Gardarsdottir, SINTEF
- Intro speaker: Monica Garcia, IEAGHG

### Topic 2: The role of CCS in enabling clean hydrogen

- Chair: Lars Ingolf Eide, Research Council of Norway
- Secretary: Gerdi Breembroek, Netherlands Enterprise Agency
- Intro speaker: Sigmund Størset, SINTEF

### Topic 3: Storage and CO<sub>2</sub> networks

- Chair: Isabelle Czernichowski-Lauriol, BRGM
- Secretary: Peter Zweigel, Equinor
- Intro speaker: Phillip Ringrose, Equinor

### Topic 4: Storage monitoring

- Chair: Katherine Romanak, University of Texas
- Secretary: Tim Dixon, IEAGHG
- Intro speaker: Tip Meckel, Gulf Coast Carbon Center

### Topic 5: Going climate positive

- Chair: Niall MacDowell, Imperial College London
- Secretary: Nils A. Røkke, SINTEF
- Intro speaker: Niall MacDowell, Imperial College London

### Topic 6: CO<sub>2</sub> utilization

- Chair: Paul Bonnetblanc, Ministry of Ecological Solidarity Transition
- Secretary: Aicha El Khamlichi, ADEME
- Intro speaker: Jaap Vente, TNO  
Mark Summers, Emissions Reduction

# MISSION INNOVATION

Accelerating the Clean Energy Revolution

## Accelerating Breakthrough Innovation in Carbon Capture, Utilization, and Storage

Report of the Mission Innovation Carbon Capture,  
Utilization, and Storage Experts' Workshop

Mission Innovation  
September 2017

# Workshop #2 - Focus

---

**This workshop** will focus on strengthening collaboration between industry sectors and research institutions, and public and private sector:

- by identifying RD&I gaps of common interest in technologies at higher TRL

The intention is to focus on potentials and possibilities, that could yield results and full-scale implementation in the short to medium-term perspective.

# Why are we here?- Expectations

---

The objective of the workshop is to contribute in transferring early (low TRL) research activities to development and innovation activities (higher TRL) by developing guidance and development paths for emerging CCUS technologies, and suggestions for new and joint development activities, with the aim of accelerating the commercialization and implementation process.

The outcome will be a brief report consisting of:

the guidance and development path documents produced during the workshop

proposals for new and joint development and innovation activities

a summary of the workshop discussions

# MI countries present

Germany	1
India	1
Japan	1
Australia	1
Iceland	1
Poland	1
Denmark	1
Republic of Korea	1
Finland	1
Spain	1
Sweden	1

# Programme

## June 19

1700	<b>Welcome and introduction</b> Program, expectations, follow-up from Houston workshop		
1730	Introductory presentations		
1900	Dinner (buffet-style) (Briefing session for Session Chairs and Secretaries)		
2000	Session 1 <b>Decarbonizing industry sectors</b>	Session 2 <b>The role of CCS in enabling clean hydrogen</b>	Session 3 <b>Storage and CO2 networks</b>
2100			
2200			

## June 20

0830	Session 1 <b>Decarbonizing industry sectors</b>	Session 2 <b>The role of CCS in enabling clean hydrogen</b>	Session 3 <b>Storage and CO2 networks</b>
1000	Session 4 <b>Storage monitoring</b>	Session 5 <b>Going climate positive</b>	Session 6 <b>CO2 utilization</b>
1200	Lunch		
1245	Session 4 <b>Storage monitoring</b>	Session 5 <b>Going climate positive</b>	Session 6 <b>CO2 utilization</b>
1415	Reporting session		
1530	Busses leave for airport		

# Sessions

---

## Questions to be discussed under each topic:

1. Which opportunities are identified from an industrial point of view?
2. How do we most effectively get from research to commercial product?
  - a. What steps are needed?
3. What joint activities could be established to accelerate technology development and implementation?
  - a. How can joint action accelerate deployment?
  - b. Business models: What funding instruments are/could/would be effective?
  - c. Mobilizing national efforts towards international efforts
  - d. Public-private partnership, co-funding

# MISSION INNOVATION

Accelerating the Clean Energy Revolution

## Carbon Capture Innovation Challenge

**Brian Allison**

**UK Department for Business, Energy and Industrial Strategy**

# Mission Innovation

- A Ministerial level initiative launched in November 2015
- **Mission Innovation's goal is to accelerate the pace of clean energy innovation to achieve performance breakthroughs and cost reductions to provide widely affordable and reliable clean energy solutions that will revolutionise energy systems throughout the world over the next two decades and beyond**

# Mission Innovation

---

- A Ministerial level initiative launched in November 2015
- **Mission Innovation's goal is** to accelerate the pace of clean energy innovation to achieve performance breakthroughs and cost reductions **to provide widely affordable and reliable clean energy solutions** that will revolutionise energy systems throughout the world over the next two decades and beyond
- MI seeks to:
  - Double Governmental Investment in Clean Energy Innovation over 5 years (2016-2021), from \$15B to \$30B
  - Increase Private Sector Engagement in Clean Energy Innovation
  - Improve Information Sharing among MI countries

# Innovation Challenges

---

- **Global Calls for Actions in High Priority Areas of Mutual Interest**
- **Opportunities for Collaboration Between Mission Innovation Members**
- **Encourage Increased Engagement by Global Research Community, Industry, and Investors**
- **Support Mission Innovation goals of reducing GHG emissions, increasing energy security and creating new opportunities for clean economic growth**
- **Outcomes May Inform, Guide and Support MI Country Investments in R&D**

# Innovation Challenges

- Global Calls for Actions in High Priority Areas of Mutual Interest
- Opportunities for Collaboration Between Mission Innovation Members
- Encourage Increased Engagement by Global Research Community, Industry, and Investors
- Support Mission Innovation goals of reducing GHG emissions, increasing energy security and creating new opportunities for clean economic growth
- Outcomes May Inform, Guide and Support MI Country Investments in R&D

# Carbon Capture Innovation Challenge

---

- **Co-Leads: Saudi Arabia, Mexico, United Kingdom**
- **20 Mission Innovation participating countries plus EU**
- **Objective**
  - Enable near-zero CO<sub>2</sub> emissions from power plants and carbon intensive industries
- **Work-Plan**
  - Organise a CCUS Experts Workshop and follow up (Trondheim June 2019)
  - Engage Stakeholders (WEF, IEA, Industry, ...)
  - Build Multilateral Collaboration Mechanisms

# MIC#3 Mid Term Review

<b>Smart Grids</b> #1  <b>Objective</b> Enable future grids powered by affordable, reliable, decentralised renewable electricity systems. <b>Co-leads</b>  CHINA INDIA ITALY	<b>Off Grid Access to Electricity</b> #2  <b>Objective</b> Develop systems that enable off-grid households and communities to access affordable, reliable renewable electricity. <b>Co-leads</b>  FRANCE INDIA	<b>Carbon Capture, Utilization, and Storage</b> #3  <b>Objective</b> Enable near zero CO <sub>2</sub> emissions from power plants and carbon-intensive industries. <b>Co-leads</b>  SAUDI ARABIA MEXICO UNITED KINGDOM	<b>Sustainable Biofuels</b> #4  <b>Objective</b> Develop ways to produce at-scale widely affordable, advanced biofuels for transportation and industrial applications. <b>Co-leads</b>  BRAZIL CANADA CHINA INDIA	<b>Converting Sunlight</b> #5  <b>Objective</b> Discover affordable ways to convert sunlight into storable solar fuels. <b>Co-leads</b>  EUROPEAN COMMISSION GERMANY	<b>Clean Energy Materials</b> #6  <b>Objective</b> Accelerate the exploration, discovery and use of new high-performance, low-cost clean energy materials. <b>Co-leads</b>  CANADA MEXICO	<b>Affordable Heating and Cooling of Buildings</b> #7  <b>Objective</b> Make low-carbon heating and cooling affordable for everyone. <b>Co-leads</b>  EUROPEAN COMMISSION UNITED ARAB EMIRATES UNITED KINGDOM	<b>new Hydrogen</b> #8  <b>Objective</b> Accelerate the development of a global hydrogen market by identifying and overcoming key technology barriers to the production, distribution, storage, and use of hydrogen at gigawatt scale. <b>Co-leads</b>  AUSTRALIA GERMANY EUROPEAN COMMISSION
<b>Top Accomplishments in 2017</b>							<b>Current Status</b>

# CCUS Experts' Workshop

- Houston 2017
- 257 Participants from Academy and Industry
- 22 Countries participated
- 13 Parallel Panel Discussions

# CCUS Experts' Workshop Structure

## Focus Areas

### CO2 Capture - Panels

Solvents

Sorbents and Looping Systems

Membranes

Combustion and Other Technologies

### CO2 Utilisation - Panels

Thermochemical Conversion and Hydrogenation of CO2

Electrochemical and Photochemical Conversion of CO2

CO2 Conversion to Solid Carbonates

Biological Conversion of CO2

### CO2 Storage - Panels

Injectivity & Capacity

Monitoring, Verification and Performance Metrics

Forecasting and Managing Induced Seismicity

Well Diagnostics

### Crosscuttings Topics (LCA,...)

# Panel Outcomes Structure

## Scientific challenges

- Brief overview of the underlying science challenge

## Summary of priority research direction (PRD)

- What fundamental research is needed to address the challenge?
- Why can this research be done now? (e.g. are there recently developed capabilities?)

## Potential scientific impact

- What impact will this research have on the CCUS scientific field?
- What impact will it have on the general scientific community?

## Potential impact on CCUS technology

- How will this impact CCUS-relevant technologies?

# CO2 Capture PRDs

## Solvents

Designing high performing solvents for CO2 capture

Creating environmentally friendly solvent processes for CO2 capture

## Sorbents

Designing tailor-made sorbent materials

Integrating sorbent materials and processes

## Membranes

Understanding transport phenomena in membrane material

Designing membrane system architectures

## Combustion and Other Technologies

Catapulting combustion into the future

Producing hydrogen from fossil fuels with CO2 capture

# CO2 Utilization PRDs

## Thermochemical Conversion and Hydrogenation of CO2

Valorizing CO2 by breakthrough catalytic transformations into fuels & chemicals

Creating new routes to carbon-based functional materials from CO2

## Electrochemical and Photochemical Conversion of CO2

Designing and controlling molecular-scale interactions for electrochemical and photochemical conversion of CO2

Harnessing multiscale phenomena for high-performance electrochemical and photochemical transformation of CO2

## CO2 Conversion to Solid Carbonates

Accelerating carbon mineralization by harnessing the complexity of solid-liquid-gas interfaces

Tailoring material properties to enable carbon storage in products

## Biological Conversion of CO2

Tailoring microbial and bio-inspired approaches to CO2 conversion

Hybridising electrochemical and biological processes for CO2 conversion to fuels, chemicals, and nutrients

Designing complex interfaces for enhancing hydrocarbon recovery with carbon storage

# CO2 Storage PRDs

## Injectivity & Capacity

Advancing multi-physics and multi-scale fluid flow to achieve gigatonne/year capacity

Understanding dynamic pressure limits for gigatonne-scale CO2 injection

## Monitoring, Verification and Performance Metrics

Optimizing injection of CO2 by control of the near-well environment

Developing smart convergence monitoring to demonstrate containment and enable storage site closure

## Forecasting and Managing Induced Seismicity

Realizing smart monitoring to assess anomalies and provide assurance

Improving characterization of fault and fracture systems

## Well Diagnostics

Achieving next-generation seismic risk forecasting

Locating, evaluating, and remediating existing and abandoned wells

Establishing, demonstrating and forecasting well integrity

# CCUS Experts' Workshop Outcomes

- Established current state of technology in CO<sub>2</sub> Capture, CO<sub>2</sub> Utilisation, and CO<sub>2</sub> Storage
- Created an international consensus on the most critical scientific challenges on CO<sub>2</sub> Capture, CO<sub>2</sub> Utilisation, CO<sub>2</sub> Storage, and Crosscutting CCUS topics
- Established internationally agreed Priority Research Directions (PRDs)
- Completed a report on CCUS Basic Research Needs
  - Intended to serve as a key resource for the international CCUS research community, governments, and the private sector, helping to inform national R&D policies and programs
  - The PRDs are not meant to be prescriptive and all-inclusive. Rather, they are designed to inspire CCUS research community to elucidate the foundational scientific phenomena that underpin CCUS

# “ACT” – An Approach to Collaboration

---

- ACT (Accelerating CCUS Technologies) grant programme has 6 MI countries (France, Germany, Norway, The Netherlands, USA and UK) who have worked together to address the Workshop PRDs. Also includes non MI countries Spain, Turkey, Greece, Switzerland and Romania which gain exposure to MI
- Added PRDs to the call text of an existing programme
- Early indication that we will have some projects that will be addressing our Workshop PRDs
- Potential for more MI countries to join for the ACT3 call in 2020
- Find out at [www.act-ccs.eu](http://www.act-ccs.eu)

# MISSION INNOVATION

---

Accelerating the Clean Energy Revolution

## **Thank You**

**from the MIC#3 Co-Leads**

**Tidjani Niass: Kingdom of Saudi Arabia**

**Nelson Nelson Mojarro Gonzalez: Mexico**

**Brian Allison: United Kingdom**

# Introduction to Topics

---

**Topic 1: Decarbonizing industry sectors (power, cement, refineries, steel, fertilizers...) • Introductory speaker: Monica Garcia, IEAGHG**

**Topic 2: The role of CCS in enabling clean hydrogen • Introductory speaker: Sigmund Størset, SINTEF**

**Topic 3: Storage and CO<sub>2</sub>-networks • Introductory speaker: Phillip Ringrose, Equinor**

**Topic 4: Storage monitoring • Introductory speaker: Tip Meckel, Gulf Coast Carbon Center**

**Topic 5: Going climate positive (biomass, waste to-energy, resources and technology) • Introductory speaker: Niall MacDowell, Imperial College London**

**Topic 6: CO<sub>2</sub> Utilization • Introductory speaker: Jaap Vente, TNO • "Success story" speaker: Mark Summers, Emissions Reduction Alberta (ERA)**

# Decarbonizing industry sectors (Power, cement, refineries, steel, fertilizers,...)

Monica Garcia Ortega

Technology Analyst, IEAGHG

Mission Innovation Challenge #3-CCUS

June 19-20<sup>th</sup> 2019, Trondheim (Norway)

*Views, findings and publications of the IEAGHG do not necessarily represent the views or policies of the IEA Secretariat or its individual member countries.*

## Who are we?

Our internationally recognised name is the IEA Greenhouse Gas R&D Programme (IEAGHG). We are a Technology Collaboration Programme (TCP) and are a part of the International Energy Agency's (IEA's) Energy Technology Network.

## Disclaimer

The IEA Greenhouse Gas R&D Programme (IEAGHG) is organised under the auspices of the International Energy Agency (IEA) but is functionally and legally autonomous. Views, findings and publications of the IEA Greenhouse Gas R&D Programme do not necessarily represent the views or policies of the IEA Secretariat or its individual member countries.

ieaghg

# Potential Role of Industrial CCUS-power

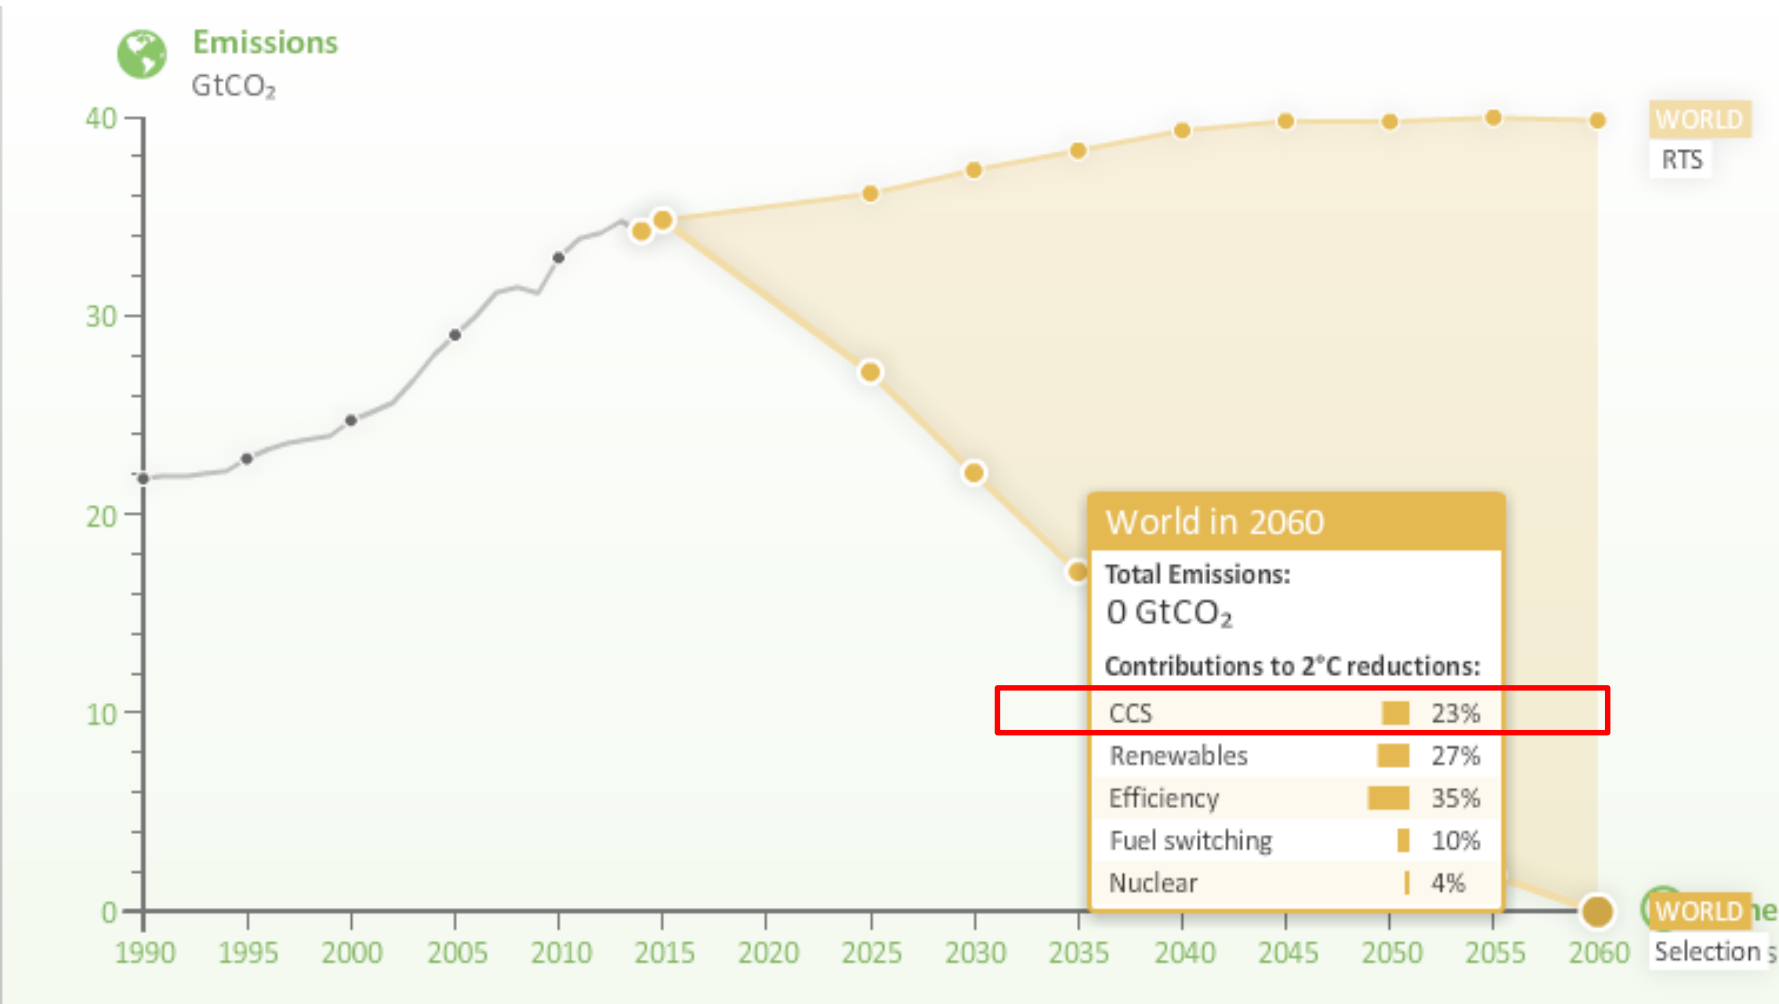

- CCUS can bring flexibility to the electricity grid (Flexeval). Important to see the System Value (SV)
- Incorporating CCS to the power sector is a cheaper solution in the long run

# Potential Role of Industrial CCUS-production industries

- Industries are essential on the economy. Expected to grow mainly in countries on development. Perhaps global market
- Industrial CO<sub>2</sub> emissions must be reduced by 50% in 2050 in the 2DS and more than 70% in the B2DS.
- Non-CCS options are important, perhaps will not supply the reduction fast and large enough to solve the climate change matters. Some industries **CANNOT** be decarbonised without CCUS (process emissions)

# Potential Role of Industrial CCUS

Emissions in the RTS and B2DS. Source: IEA ETP website  
(visited in May 2019)

# Potential Role of Industrial CCUS- Power

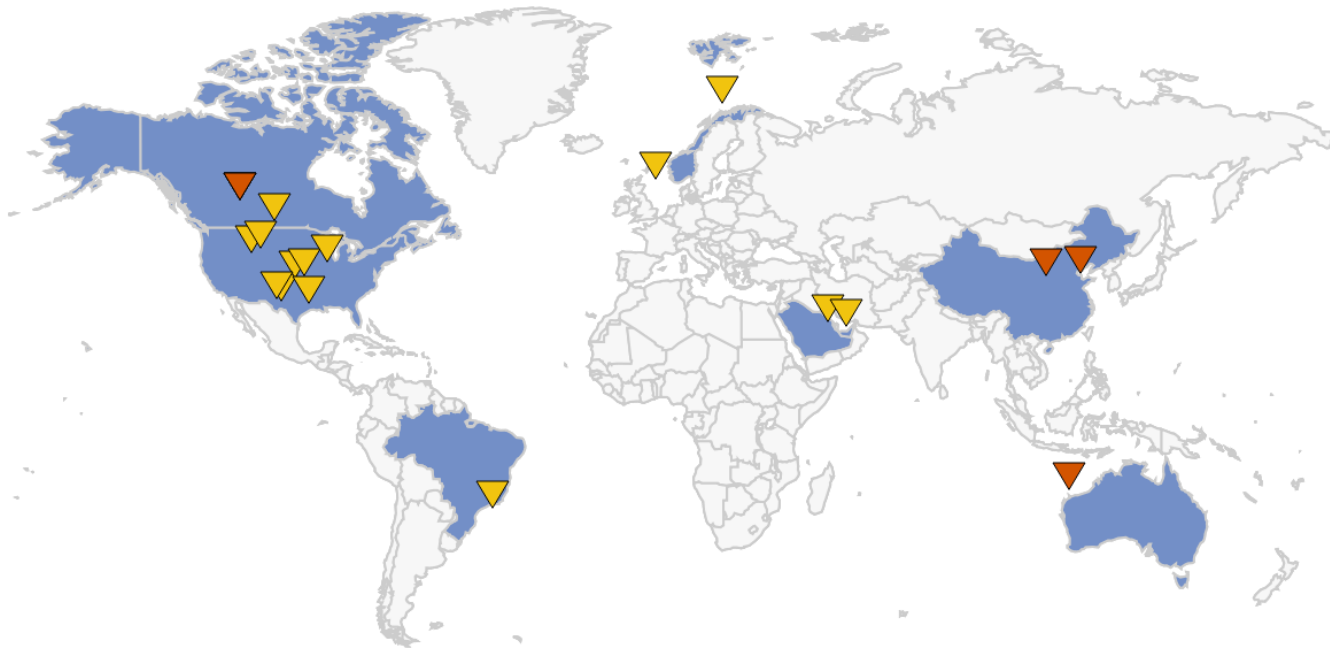

- Large projects: Boundary Dam (Cansolv), Petranova (KM-CDR), Shand (planned, KM-CDR). It works!
- IEAGHG update on emerging technologies  
TRL: chemical absorption is still leading (with updated benchmark solution), 2<sup>nd</sup> generation will not wait for others. Potential for fuel cells, membranes. More research in others

# Potential Role of Industrial CCUS- Production industries

CCUS projects in industry

© OECD/IEA © Natural Earth

Industrial CCUS projects in construction (red) and running (yellow). Source: IEA website (last update on 2018)

# Potential Role of Industrial CCUS

- Industries: steel, cement, chemicals, refining, hydrogen, natural gas, heavy oil, fertilizers, waste to energy. Interaction
- Aiming to transfer the experience from the power sector (to note TRL is not the same!). Traditional chemical absorption is the “less risky”, perhaps specific industries can have advantages for others and/or traces
- IEA perspective: out of track to reach decarbonisation objectives

# Status- Progress

- Industries have a good potential for partial CO<sub>2</sub> capture. Opportunity for integration and cost reduction
- Cement
  - Several CO<sub>2</sub> capture technologies tested
  - Norcem, LEILAC (TRL 7ish), ECRA?
  - Others (TRL 7ish): CLEANKER, CEMCAP (TRL4)

Norcem facilities  
(Norway)

# Status- Progress

- Steel
  - Heterogeneity in production process. Several CO<sub>2</sub> stacks, several technologies
  - Abu Dhabi (DRI, TRL 9ish). H<sub>2</sub> potential
  - STEPWISE (BF+BOF, TRL 7ish), COURSE50

Al Reyadah facilities (Abu Dhabi)

# Status- Progress

- Waste-to-energy
  - Japan, Norway and Netherlands projects, all based in chemical absorption
  - Seasonal integration with district heating, heat integration with the facility
- Refining (familiar)
  - Interaction with  $H_2$
  - Chemical absorption on stacks (Finland), oxy-firing in burners, pre-combustion on the gasifiers.
  - RECAP, suggesting non-steam technologies

# Status- Progress

- Hydrogen
  - Low carbon electricity+CCS
  - Air Products' Port Arthur, Tomakomai, Air liquid (SMR)
  - Chemical/physical absorption, sorbents, PSA, membranes
- Fertilizers
  - 2 plants in USA, Yara (cancelled): opportunity of using ammonia
  - Linked to chemicals, H<sub>2</sub> (SMR, POX)

Yara facilities (Norway)

# Status- Progress

- Chemicals
  - Heterogeneous sector
- Natural Gas
  - Sleipner and Snohvit, Terri , Shute Creek, Century Plant, Salah, Gorgon.
  - Commonly sorbents, CCUS
- Heavy oil
  - Linked to  $H_2$
  - Diluted  $CO_2$

# Key research and innovation challenges

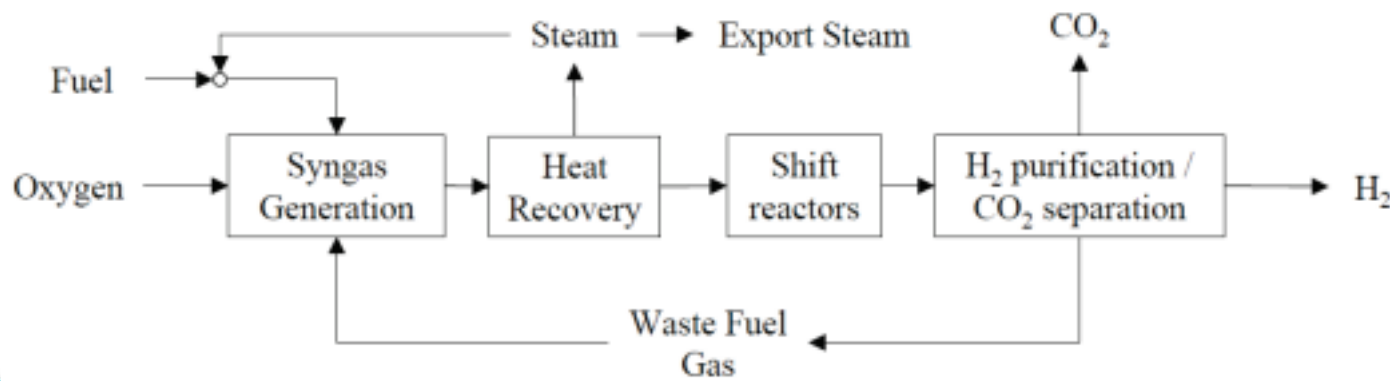

- Identified areas of research in the previous report :
  - C1-solvents
  - C2-sorbents
  - C3-membranes
  - Targeted application: industrial sector
  - Hydrogen

# Key research and innovation challenges

- Hydrogen: PRD C-8, linked to CO<sub>2</sub> capture technologies challenges
  - Gasification challenges (high TRL)
  - Reforming with O<sub>2</sub> via high-temperature membranes and integrated with H<sub>2</sub> production
  - Combustion and reforming: microchannel reactors
  - Challenges related to operation , turbines, flames

# Key research and innovation challenges

- Development of CO<sub>2</sub> capture technologies as for the power sector. Some are still at low TRL. Explore opportunities (higher CO<sub>2</sub> concentration, partial capture, energy/heat integration)
- To make the difference between power and industrial sectors
- Increase CCUS deployment

# Steps towards, closing gaps for deployment and industrial opportunities

- There are many challenges for the deployment of industrial CCUS, but those can be successfully addressed to enable a decarbonised industry (BEIS, 2018)

# THE ROLE OF CCS IN ENABLING CLEAN HYDROGEN

Sigmund Ø. Størset, SINTEF

Mission Innovation Workshop,

June 19th 2019

1. Security of supply

# ENERGY

2. Cost

3. Environmental footprint

# Where can we use hydrogen?

**A true cross sectorial enabler – in hard to decarbonise sectors**

- Industry
- Heating/cooling/cooking
- Power- also zero emission backup for intermittent power
- Transportation- land, rail – possibly aviation-hybrid, marine
- Energy storage- on longer timescales

# Hydrogen by source and consumption

Source: International Journal of Hydrogen Energy, Voldsund et al.

Source: The essential chemical industry - online

Global annual production: ~65M metric tons / ~2200 TWh

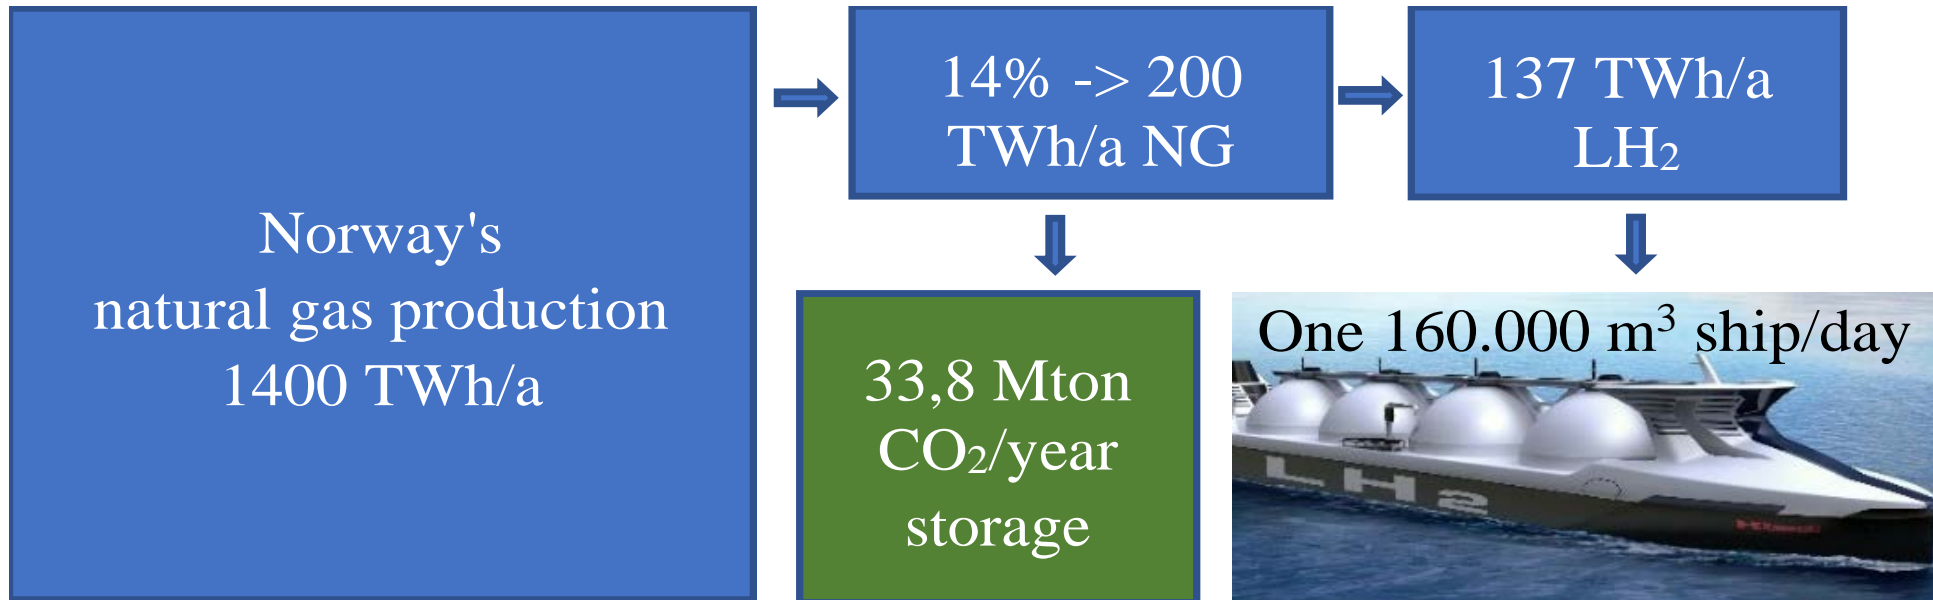

# Norway: Renewable power and fossil energy

# A thought example from Norway

---

# Almost 20% of current European CO<sub>2</sub> emissions can be abated by clean hydrogen in 2050

A satellite night view of Europe, showing the continent illuminated by city lights. The lights are concentrated in major urban centers and along coastlines, creating a glowing pattern against the dark background of the land and sea. The text is overlaid on the left side of the image.

Hydrogen from natural gas with CCS  
is an **opportunity** for Europe.

---

# Mythbusting: "Blue hydrogen" vs. "Green hydrogen"

## Post-commissioning CO<sub>2</sub>-equivalent emissions:

CO<sub>2</sub>-intensity of hydrogen from electrolysis vs. from autothermal reforming with 93.4 % CO<sub>2</sub> capture intersect at approximately 16 gCO<sub>2</sub>/kWh<sub>el</sub>

# CO2 grid intensity for different countries (Bellona)

# Hydrogen produced from natural gas with CCS will have lower GHG emissions than hydrogen from electricity in the EU grid for decades

- Comparison of greenhouse gas emissions related to production of hydrogen from
  - European grid electricity via electrolyzers
  - Natural gas with carbon capture
- Hydrogen production from natural gas using autothermal reformers with 93 % (2016) to 96 % (2030 - 2050) CO<sub>2</sub> capture ratio
- European grid electricity mix shown in the pie-chart – forecasts based upon the IRENA Remap case for 2030 and the decarbonised scenarios from "A Clean Planet for All" for 2050
- Without deep decarbonization of the European power generation, emissions from production of hydrogen from dedicated renewably based electricity must account for potentially reduced emission reductions of the power sector

## Hydrogen

from natural gas with CCS could generate

**NOK 220 billion  
annually in 2050**

**25,000 – 35,000  
jobs**

From the SINTEF report:  
Industrielle muligheter og arbeidsplasser  
ved CO<sub>2</sub>-håndtering i Norge

**SINTEF,  
April 2018**

Teknologi for et bedre samfunn

Mission Innovation workshop  
Trondheim, June 19-20

## Session 3 – Storage and CO<sub>2</sub> networks

Introduction – Philip Ringrose, Equinor & NTNU

# What we focused on in the 2017 MI Workshop

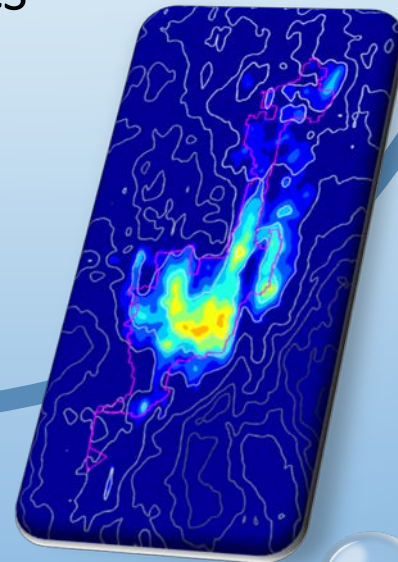

- Sequestration has to get to gigatonne (Gt) per year scale to meet global CO<sub>2</sub> emissions reductions targets.
- We know how to do 1Mt per year projects (e.g. Sleipner)
- We have sufficient capacity for Gt storage (in theory)
- BUT ...
  - Many technical challenges need to be addressed
  - The world's nations must want to do CCS

Vison and road-map for scale-up from Mission Innovation CCUS

**Pore scale:**  
nano to dm scale

HPC:  
10<sup>7-9</sup> voxel models  
Highly parallelized

**Field scale:**  
dm to km scale  
HPC:  
10<sup>7-8</sup> cell models  
100's-1000's CPUs  
Uncertainty handling via multiple realizations

**Basin scale:**  
10s – 100s km

HPC:  
10<sup>8-10</sup> voxels  
Multi-models/datasets  
Parallelized

# Topics covered in the 2017 MI Workshop

Focus Area 3: CO<sub>2</sub> storage - Co-Chair Don DePaolo (USA)

- **Panel S1: Injectivity and Capacity**  
Panel Leads: Philip Ringrose (NOR) and Curt Oldenburg (USA)
- **Panel S2: Monitoring, Verification and Performance Metrics**  
Panel Leads: Ziqiui Xue (JPN) and Jonathan Pearce (UK)
- **Panel S3: Forecasting and Managing Induced Seismicity**  
Panel Leads: Hideo Aochi (FRA) and David Eaton (CAN)
- **Panel S4: Well Diagnostics**  
Panel Leads: Franz May (GER) and Rick Chalaturnyk (CAN)

Accelerating Breakthrough Innovation in  
Carbon Capture, Utilization, and Storage

Report of the Mission Innovation Carbon Capture,  
Utilization, and Storage Experts' Workshop

Mission Innovation  
September 2017

U.S. DEPARTMENT OF  
**ENERGY**

  
Kingdom of Saudi Arabia  
Ministry of Energy, Industry & Mineral Resources

# PRDs identified for CO<sub>2</sub> storage

Nine 'Principle Research Directions' (PRDs) were identified

1. Advancing multiphysics and **multiscale fluid flow** to achieve gigatonne/year capacity
2. Understanding **dynamic pressure limits** for gigatonne-scale CO<sub>2</sub> injection
3. Optimizing injection of CO<sub>2</sub> by **control of the near-well environment**
4. Developing **smart convergence monitoring** to demonstrate containment and enable storage site closure
5. Realizing smart monitoring to **assess anomalies** and provide assurance
6. Improving characterization of **fault and fracture systems**
7. Achieving next-generation **seismic risk** forecasting
8. Locating, evaluating, and remediating existing and **abandoned wells**
9. Establishing, demonstrating and forecasting **well integrity**

## Accelerating Breakthrough Innovation in Carbon Capture, Utilization, and Storage

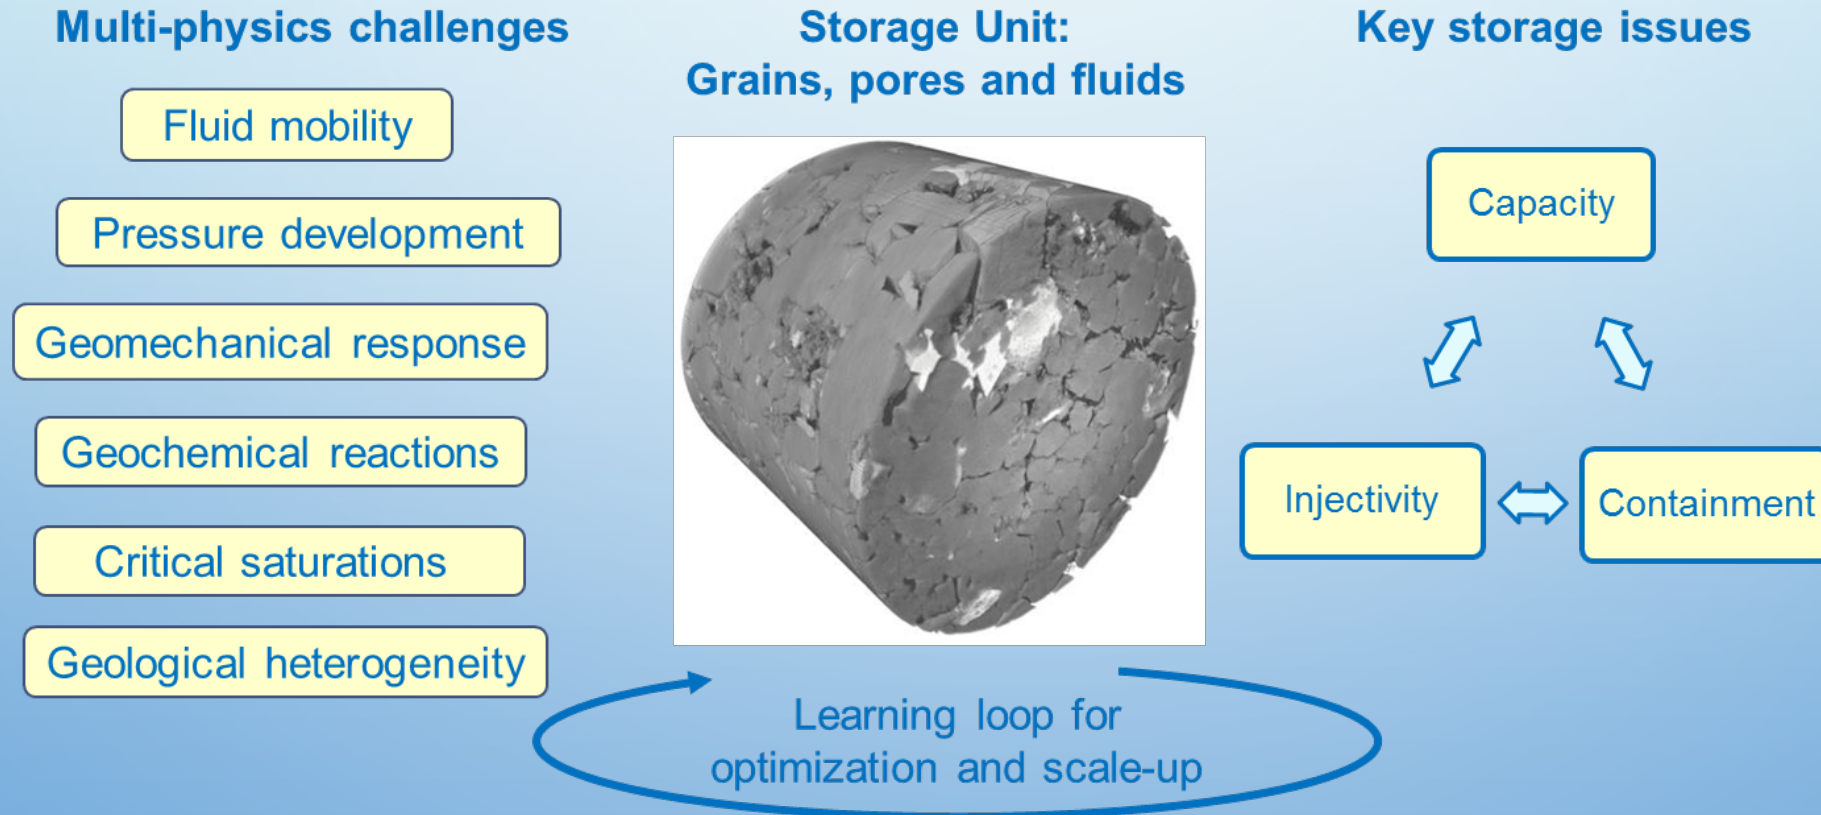

Report of the Mission Innovation Carbon Capture, Utilization, and Storage Experts' Workshop

Mission Innovation  
September 2017

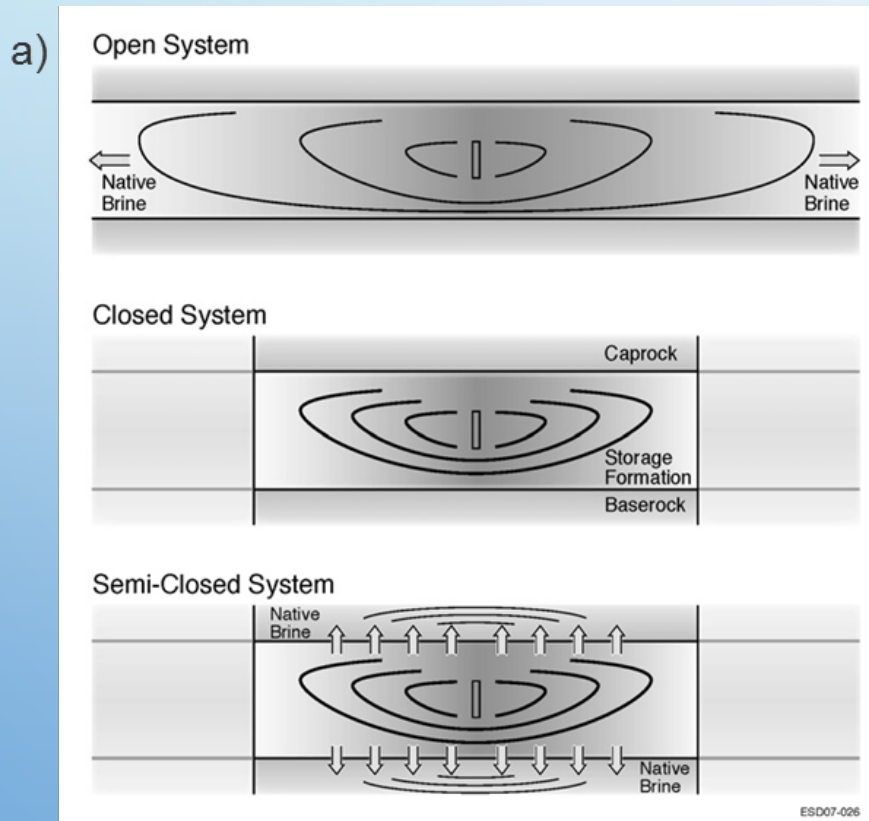

# Some reflections on technology for maturing Gt storage - 1

- Many ongoing R&D projects on CO<sub>2</sub>-brine flow properties, geomechanics and pressure modelling
- But **how do we transfer these learnings to emerging storage project developments?**

# Some reflections on technology for maturing Gt storage - 2

- Much discussion and speculation on practical limits to capacity – especially pressure limits
- But **how do we turn concerns into carefully evaluated capacity estimates for projects?**

(a) Open, closed, or semi-closed systems [Image from Zhou et al. 2008]

(b) Typical 3D geometries of semi-open and semi-closed geologic storage systems.

## Some reflections on technology for maturing Gt storage - 3

- Many ongoing R&D projects on monitoring systems, geomechanics/seismicity, well integrity
- But **how do we turn concerns into acceptable risks for managed projects?**

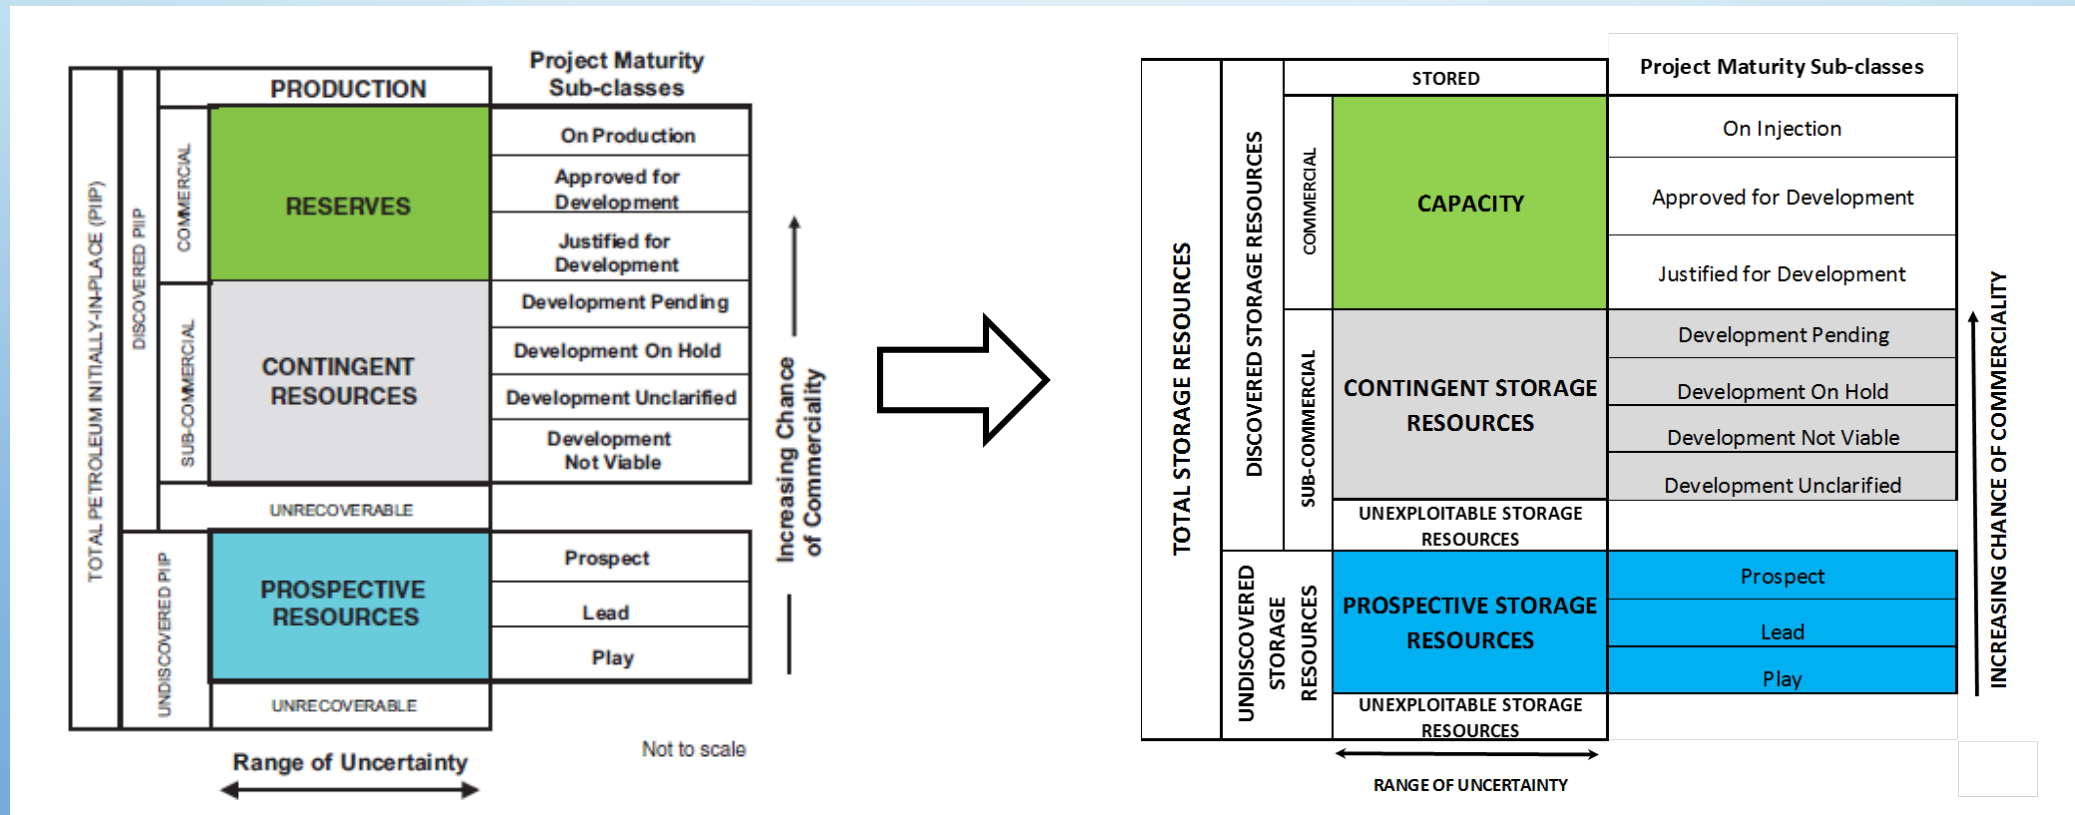

Sub-sea injection monitoring systems (Image from Equinor)

Core analysis

# Finding a system for maturing storage resources

- SRMS (storage resource management system) is a framework for resource reporting derived from long established Petroleum Resources system (SPE)
- ALIGN CCUS project has proposed a practical approach to maturing CO<sub>2</sub> Storage Readiness Levels (SRLs)

# Finding ways to manage storage project risks

1. Public perception risks
  - Needs effective communication strategy
2. Market failure risks
  - Significant and hard to handle
3. Site performance risks
  - Good track record, technically manageable

Climate and surface risks

Subsurface risks

Bow-tie risk assessment methodology is applied to most projects now

# CCS hubs – strength from collaboration

- Northern Lights ‘open-source storage’ has already been an effective catalyst for CCS in Europe
- But we need more efforts on working together on integrated common solutions for CCS

## CO<sub>2</sub> storage hubs:

- Reduces risk and threshold for others
- Enables additional CO<sub>2</sub> storage

- Allows stepwise development of CCS from more regional hubs

- Norway CCS hub:  
Catalyst for roll-out of CCS in Europe?

## Summary of challenges

1. How do we **transfer learnings** from 'R&D in the lab' to emerging storage project developments?
2. How do we turn **concerns about capacity** into carefully evaluated estimates for projects?
3. How do we turn **concerns about storage risks** into acceptable project management plans?
4. How do we **use the digital revolution** to build confidence in CO<sub>2</sub> storage as a public good / climate mitigation action?
5. How do we use **CCS hubs** to accelerate storage?

# **Topic 4: Storage Monitoring**

## **Introduction – Tip Meckel**

**Mission Innovation workshop**

**Trondheim, Norway**

**June 19-20, 2019**

BUREAU OF  
ECONOMIC  
GEOLOGY

# Outline

- **Review of 2017 Report: Accelerating Breakthrough Innovation in CCUS**
  - **Priority Research Directions**
  - **Scientific Challenges Identified**
- **Example rubrics & framing considerations**

# Panel S2: Monitoring, Verification, and Performance Metrics

Panel Leads: Ziqiui Xue (JPN) and Jonathan Pearce (UK)

- Advances in monitoring are needed to enable storage performance verification at a higher level of certainty, both during and following injection operations.
- Areas where basic research could lead to critical improvements include:
  - sensor and tracer technology
  - remote monitoring
  - joint inversion methods for geophysical data
  - optimized design of monitoring and information systems

# PRDs identified for Monitoring, Verification and Performance Metrics

- S-4: Developing **Smart Convergence Monitoring** to Demonstrate Containment and Enable Storage **Site Closure**
- S-5: Realizing **Smart Monitoring** to Assess Anomalies and Provide Assurance

# Monitoring Panel Report - Scientific Challenges Identified

- Transforming far-field monitoring with new tools to directly measure state variables
- Smart monitoring in the far-field
- Improving methodologies for monitoring plans
- Improving interpretation and use of large, complex data sets
- Assessing anomalies and providing assurance – location, attribution, quantification

# IEAGHG CO<sub>2</sub> Monitoring Tools (2010; Online tool also) IJGGC Special Issue (2015) Lots of BPM

Mathieson et al., 2010

			deep	shallow	Plume location / migration	Fine scale processes	Leakage	Quantification
Seismic		3D/4D surface seismic						
		Time lapse 2D surface seismic						
		Multi-component surface seismic						
	Acoustic imaging	Boomer/sparker profiling						
		High resolution acoustic imaging						
	Well based	Micro-seismic monitoring						
		4D cross-hole seismic						
4D vertical seismic profiling								
Sonar bathymetry		Sidescan sonar						
		Multi beam echo sounding						
Gravimetry		Time lapse surface gravimetry						
		Time lapse well gravimetry						
Electric/electromagnetic		Surface EM						
		Seabottom EM

Remote sensing		Airborne hyperspectral imaging						
		Satellite interferometry						
		Airborne EM						
Others		Geophysical logs						
		Downhole Pressure / temperature						

# Monitoring

- **WHY/WHO:** Operations, Regulatory, Public
  - **WHAT:** Property/State, Tools, Technology
    - Quantification precision & limitations
  - **HOW:** Strategy; FOAK or routine.
  - **WHERE:** Near/far field; Shallow/deep;
  - **WHEN:** Risk profile, Active/passive
- 
- Transparency
  - Cost effective (not same as inexpensive)
  - Integration (consistency)
  - Evolution of strategies, techniques and technologies.
  - Verify conformance, predict future performance (model matching) & repeat = assurance!

# Closing gaps for deployment and industrial opportunities: Where should we look for innovation in monitoring?

- Two camps:
  - ‘We have what we need, it just needs to be better’ (high TRL)
  - ‘The better/best tool is still out there, just need to find it’ (low TRL)
  
- The brain
- The computer
- The lab
- The field
  
- **Other fields:** oilfield, robotics (AUV), computing, medical, materials, data management, pattern recognition
  - **CCS Technology Ambassadors?**

**THANK YOU**

# Does BECCS work?

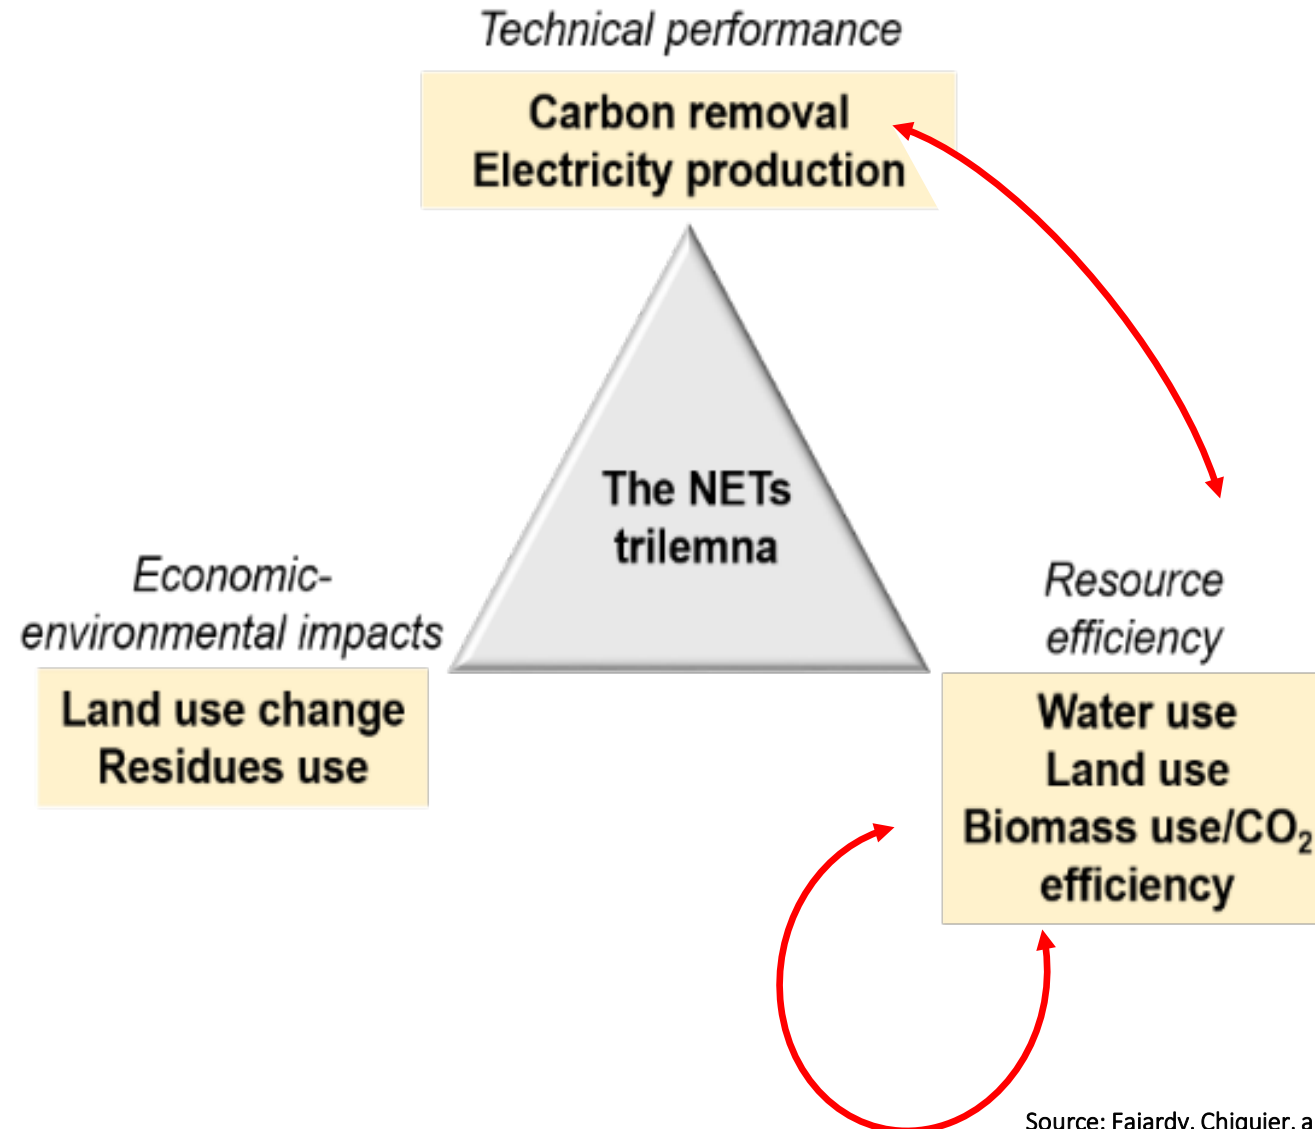

# Does BECCS generate power?

# Low carbon vs. carbon negative energy systems

# Trade-offs within the land-water-carbon-energy nexus

# Who has to do what..?

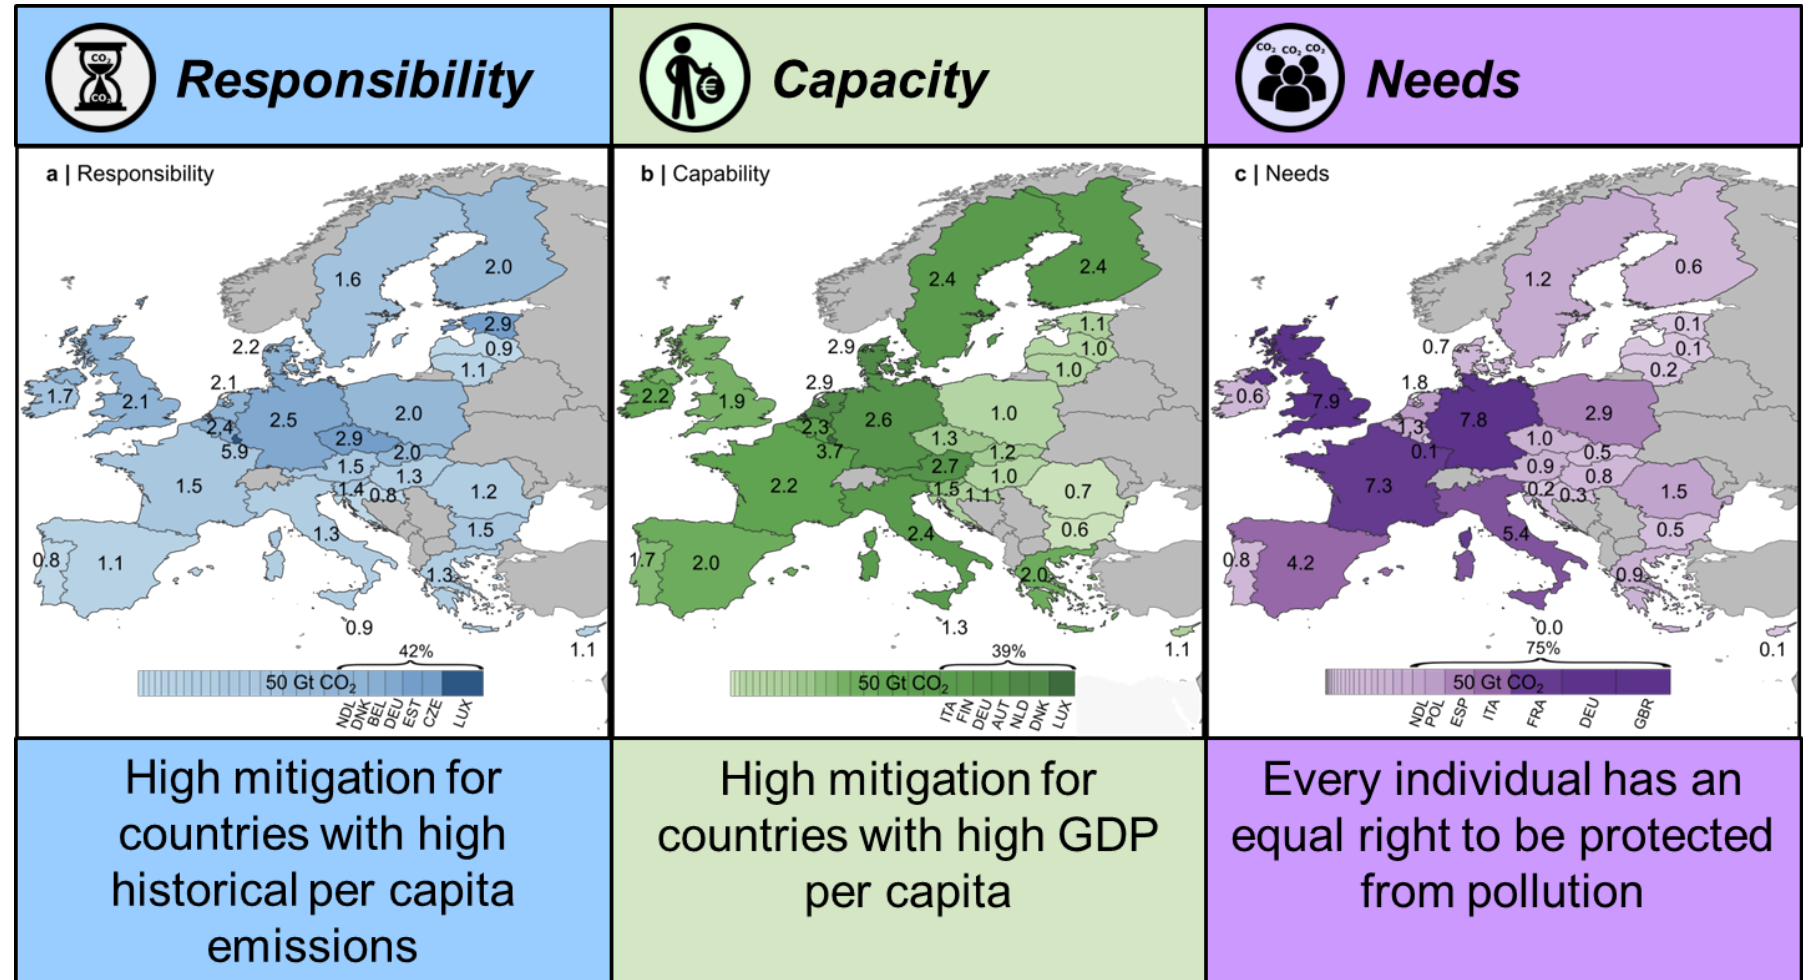

$$target(i) = G_{target} \cdot \frac{x(i)}{\sum_{world} x(i)}$$

- **Equity:**  $x(i)$  = population in 2014
- **Responsibility** – current CO<sub>2</sub> emissions:  $x(i)$  = CO<sub>2</sub> emissions in 2014
- **Responsibility** – historical CO<sub>2</sub> emissions:  $x(i)$  = cumulative CO<sub>2</sub> emissions 1975-2014
- **Responsibility** – current GHG emissions:  $x(i)$  = GHG emissions in 2014
- **Responsibility** – historical GHG emissions:  $x(i)$  = cumulative GHG emissions 1850-2014

# What might this look like at the national level?

-  Responsibility: per-capita historical (1960-2017) CO<sub>2</sub> emissions
-  Capacity: per-capita GDP
-  Needs: country population

# Limited potential for individual action

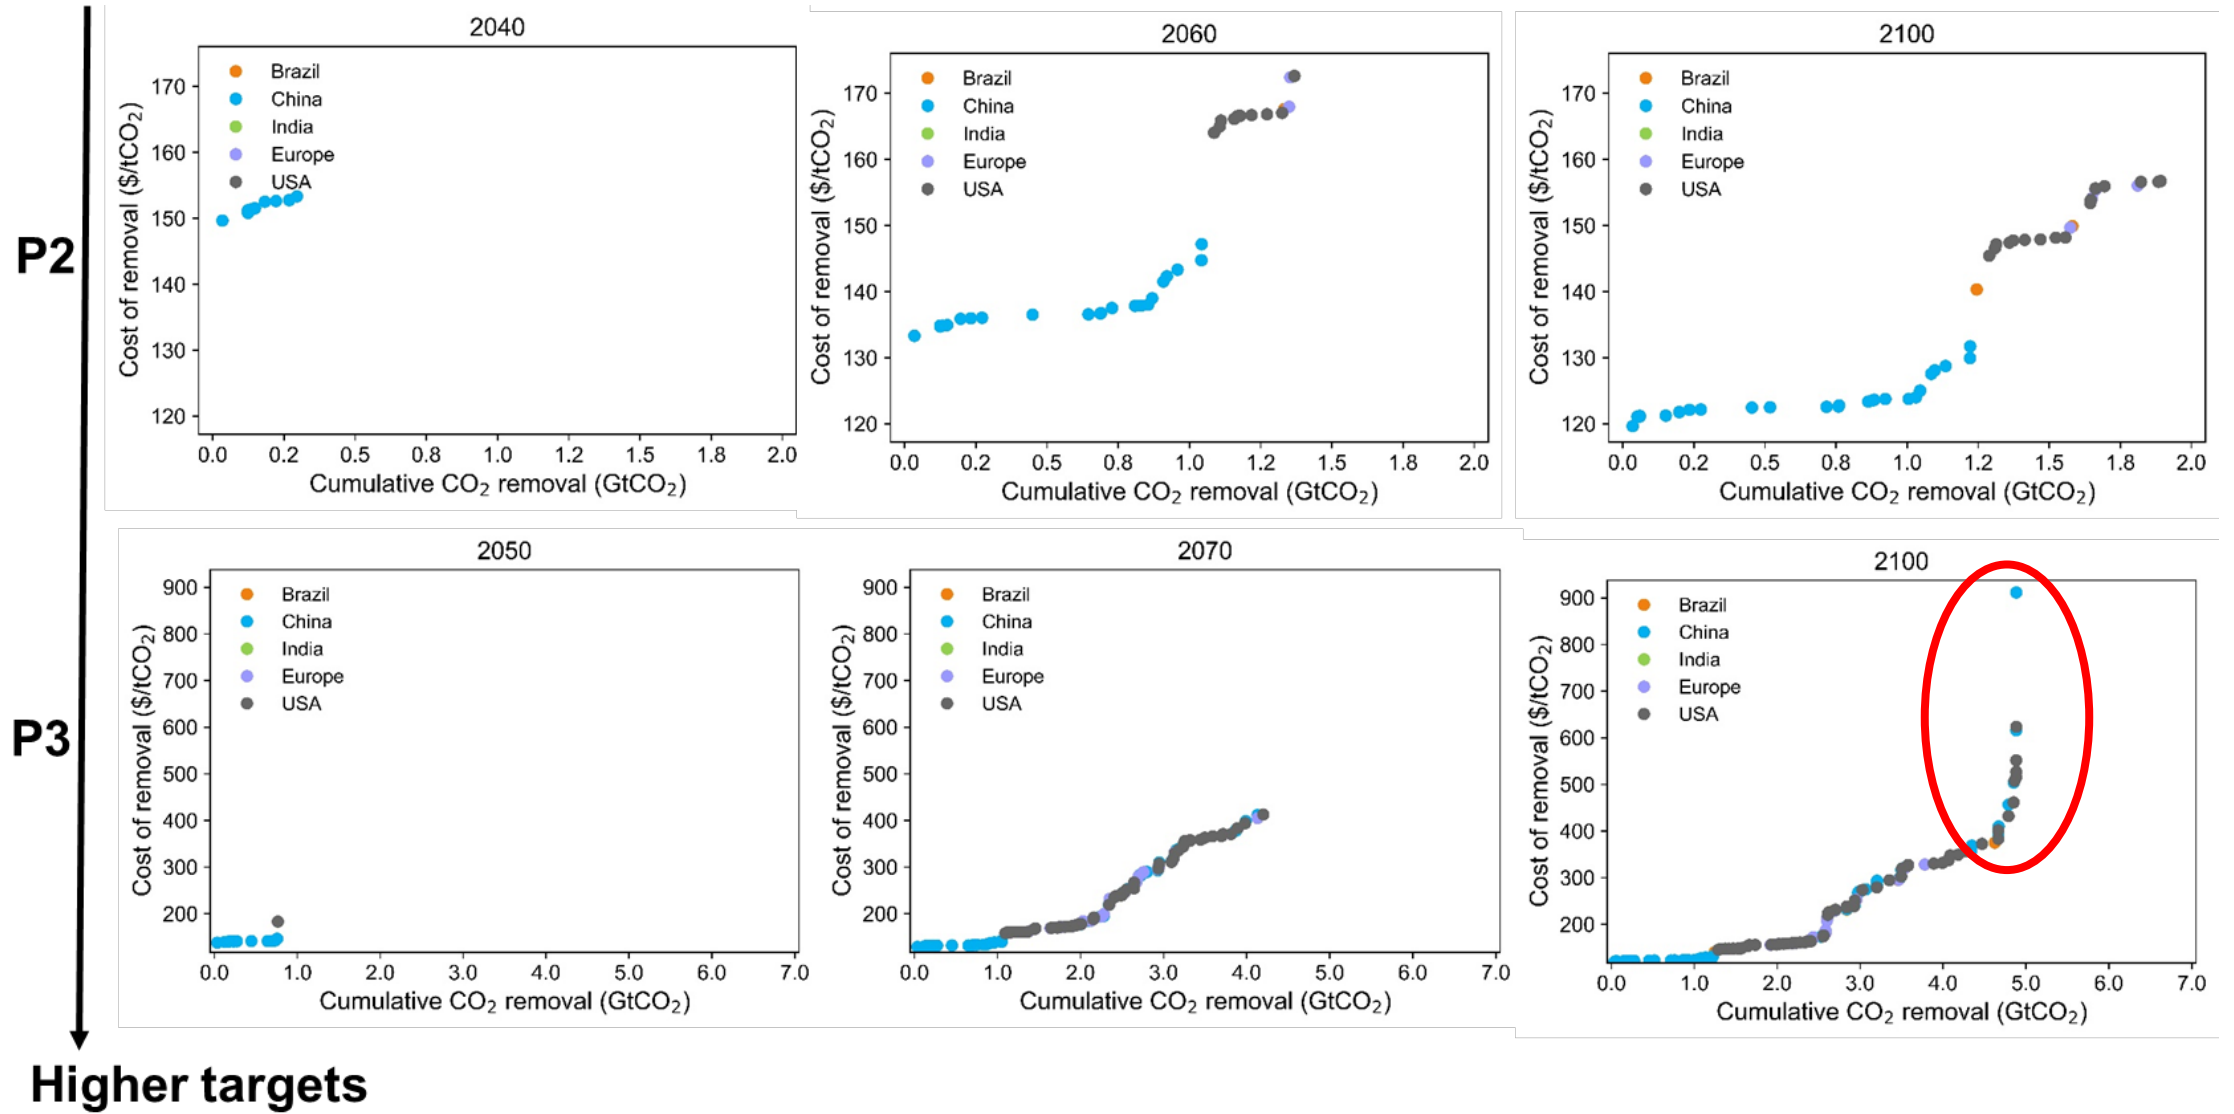

# The value of cooperation

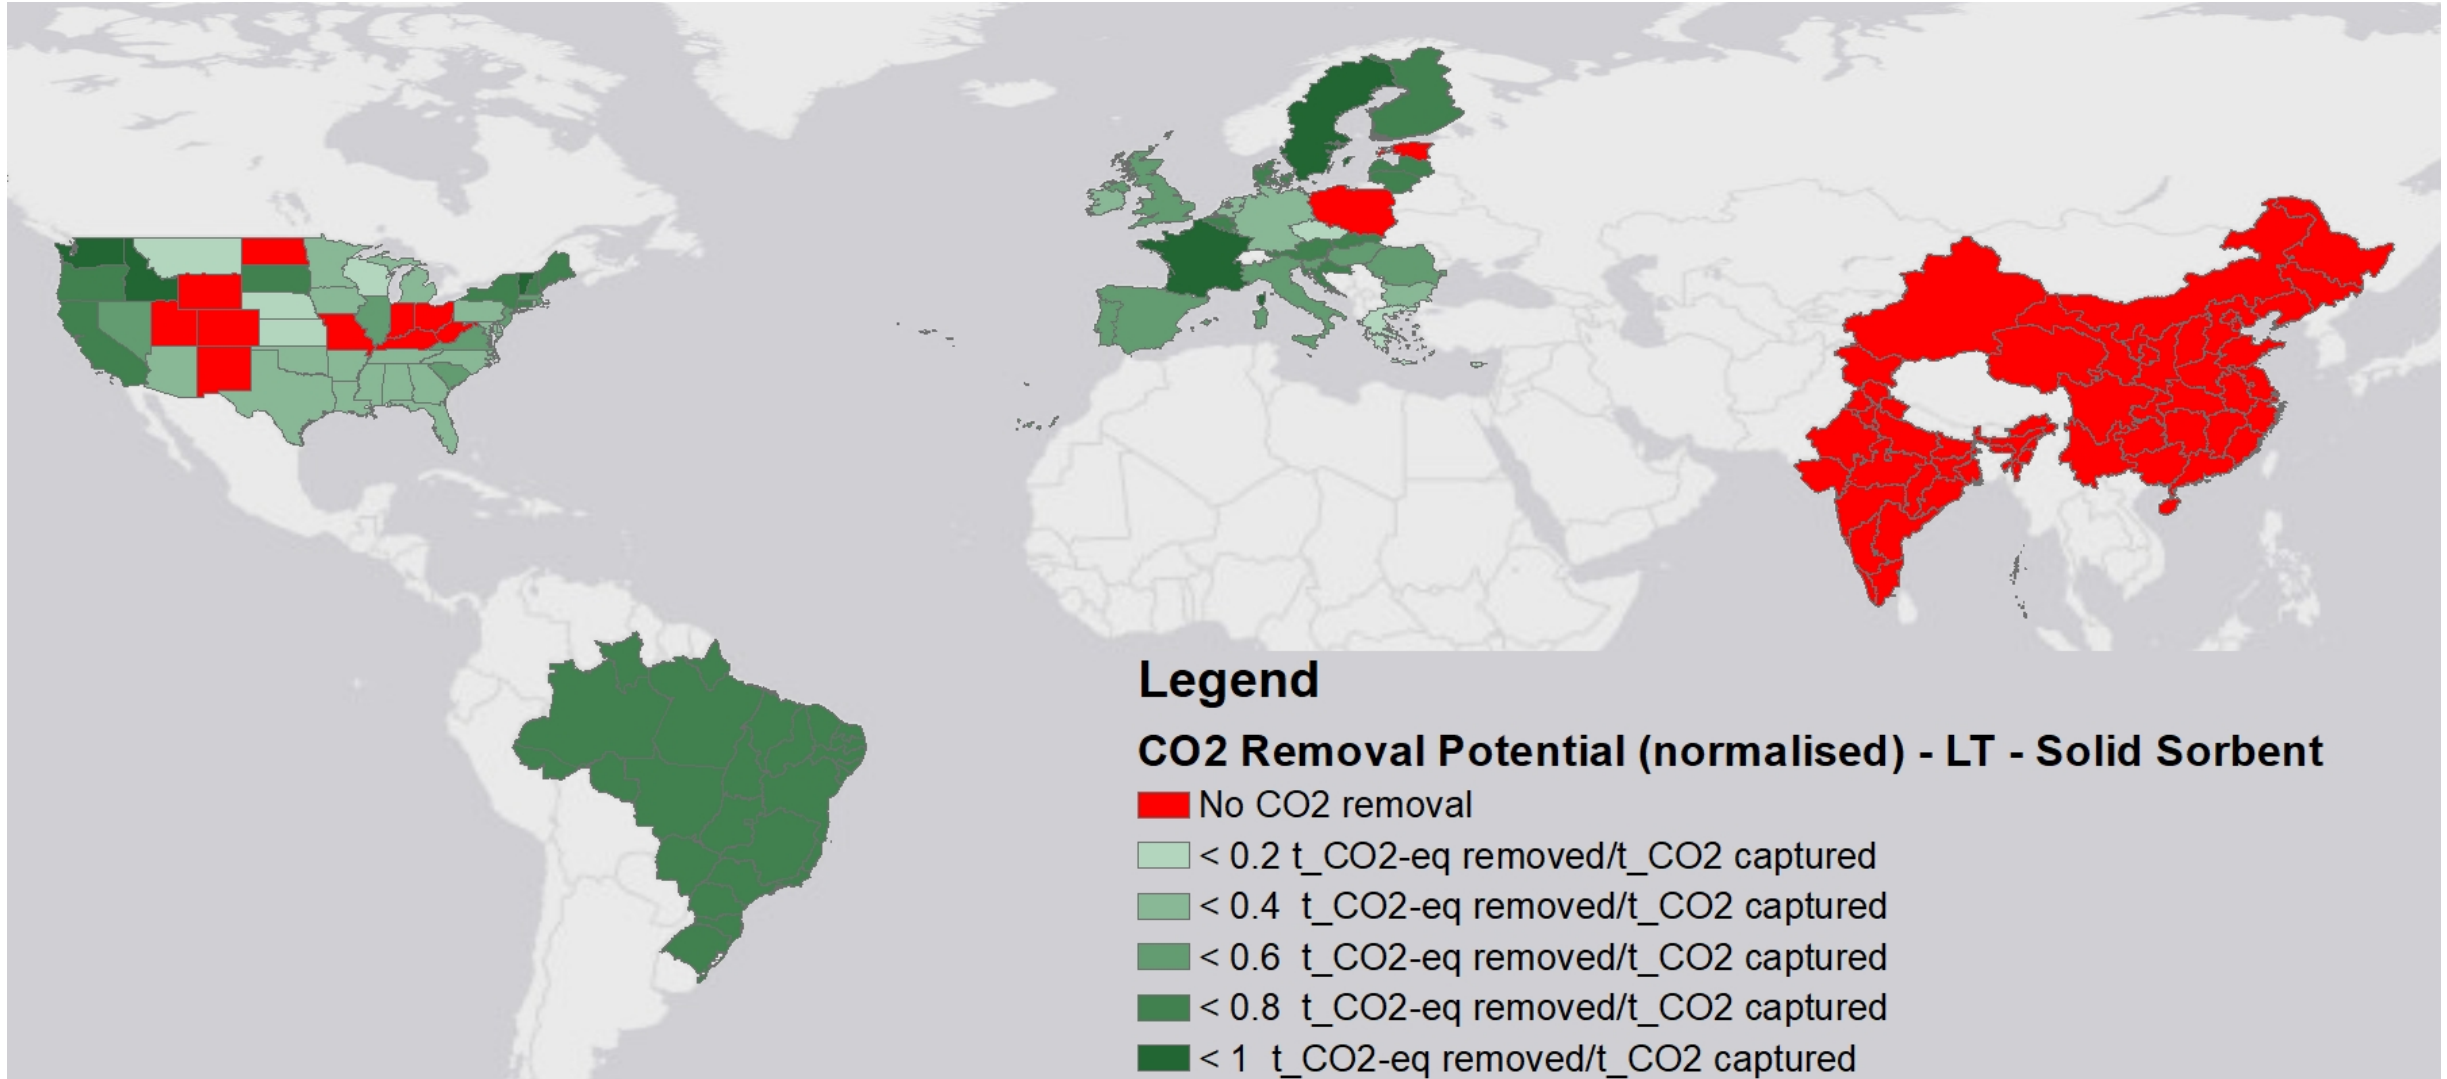

- Different players bring different values :
  - **‘Independent providers’** (e.g. China): regions with good storage availability, low cost and low carbon biomass close to storage sites >> **much higher cost if excluded** as they can no longer provide surplus for other regions
  - **‘Independent beneficiaries’** (e.g. EU and US): region with good storage and biomass availability but higher cost >> **higher cost if excluded** as they have to fulfil their own targets
  - **‘Dependent beneficiaries’** (e.g. Brazil and India) : unable to meet their own targets due to lack of storage >> **unmet CO<sub>2</sub> removal target if excluded**

# BECCS supply curve

# A role for alternatives: Direct Air Capture (DAC)

# Different options, different challenges

## BECCS

## DACS

## AR/RE

## Biochar

## EW

### Regional constraint(s)

- CO<sub>2</sub> storage capacity
- Biomass feedstock
- Accessible and available land
- Water

- CO<sub>2</sub> storage capacity
- Low carbon energy

- Productive and available land
- Water
- Albedo effect

- Biomass feedstock
- Accessible land (may be combined with other uses)

- Accessible land (may be combined with other uses)
- Availability of minerals

### CO<sub>2</sub> accounting and monitoring

- Cross border supply chain emissions
- Delayed CO<sub>2</sub> removal
- CO<sub>2</sub> stored permanently

- Immediate CO<sub>2</sub> removal
- CO<sub>2</sub> stored permanently

- Immediate CO<sub>2</sub> removal
- Permanence subject to monitoring
- Sink saturation

- Delayed CO<sub>2</sub> removal
- Permanence subject to monitoring
- Sink saturation

- Immediate CO<sub>2</sub> removal
- Sink saturation

### Regional variability of performance

- Yield, water requirement, sustainable biomass availability

- Cost
- Carbon footprint of energy

- Growth rate
- Risk of releasing CO<sub>2</sub>

- CO<sub>2</sub> uptake

# Research and innovation challenges

- NETs and GGR are still nascent
- Many remaining research challenges
  - Technology demonstration and price discovery is a work in progress
  - For BECCS,
    - We need to properly understand the value of the co-products
    - Is bioelectricity the best use of the biomass? Heat? Power? Mobility? H<sub>2</sub>?
  - Scalability, permanence of CO<sub>2</sub> removal, and broader sustainability
  - Social license and political economy, in particular, remain unclear
  - How will different countries, and regions, collaborate for optimal deployment?
  - How will NETs/GGR be incentivised, monitored, and regulated?

**ON CCU(S)**

Jaap Vente

Mission Innovation Session

19 – 20 June 2019

 **ECN** |  **TNO** innovation  
for life

# SCENARIO ANALYSIS RESULTS FOR CCUS

- › CCS will be required to reduce emissions of any remaining fossil fuels use (power sector, industry)
- › In the case of higher ambition targets, CCS combined with biomass is required to generate negative emissions
- › It also seems necessary for certain hard to decarbonize industrial processes
- › CCU – synthetic fuels and materials (e.g. in plastics) are also seen as options

# CONVERTING CO<sub>2</sub>

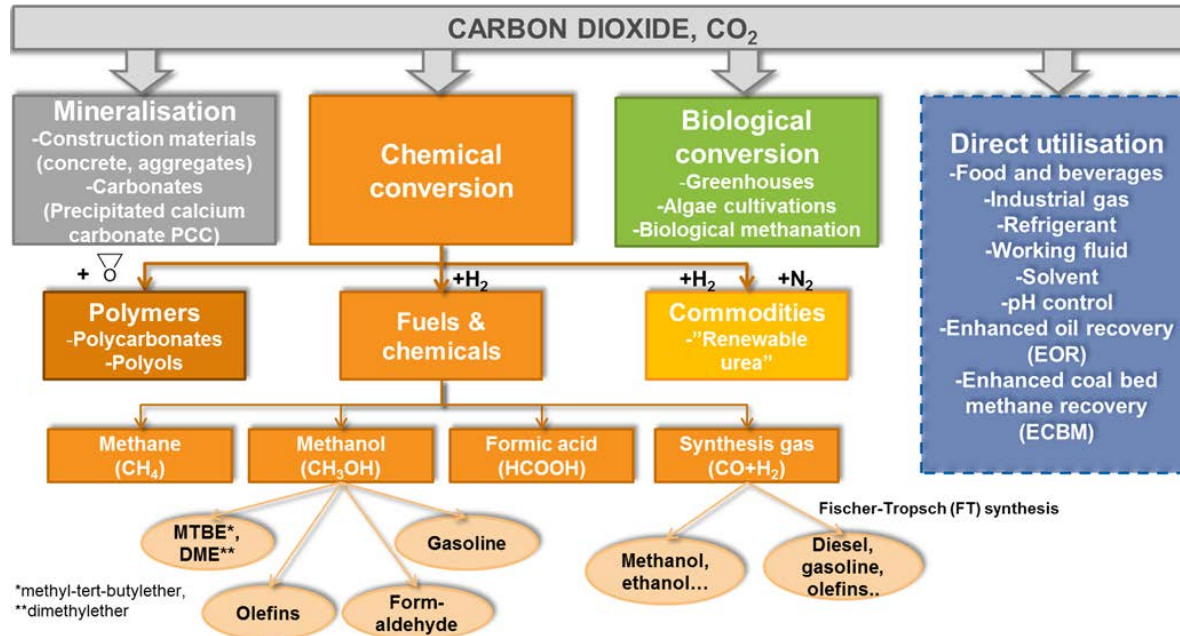

Science direct

Smart spec platform

# MAIN ROUTES

## Main CO<sub>2</sub> utilisation routes and applications

\*methyl-tert-butylether,  
\*\*dimethylether

# POTENTIAL

# PRODUCTION POTENTIAL: CO<sub>2</sub>-BASED

› Annual global CO<sub>2</sub>-production in steel industry vs. current annual markets

# MANY INITIATIVES

Covestro Polyols

CRI Methanol

H2020 Steelanol

H2020 FReSMe project

# CHALLENGES

- › Often renewable H<sub>2</sub> required
- › Most often other options are economic more favourable
- › Climate benefits are questioned
- › Many routes are still in infancy

A POSITIVE BUSINESS CASE

# ENERGY CONTAINING RESIDUAL STREAMS

- › Unique feature of current steel making processes
- › Presence of diluted energy containing streams

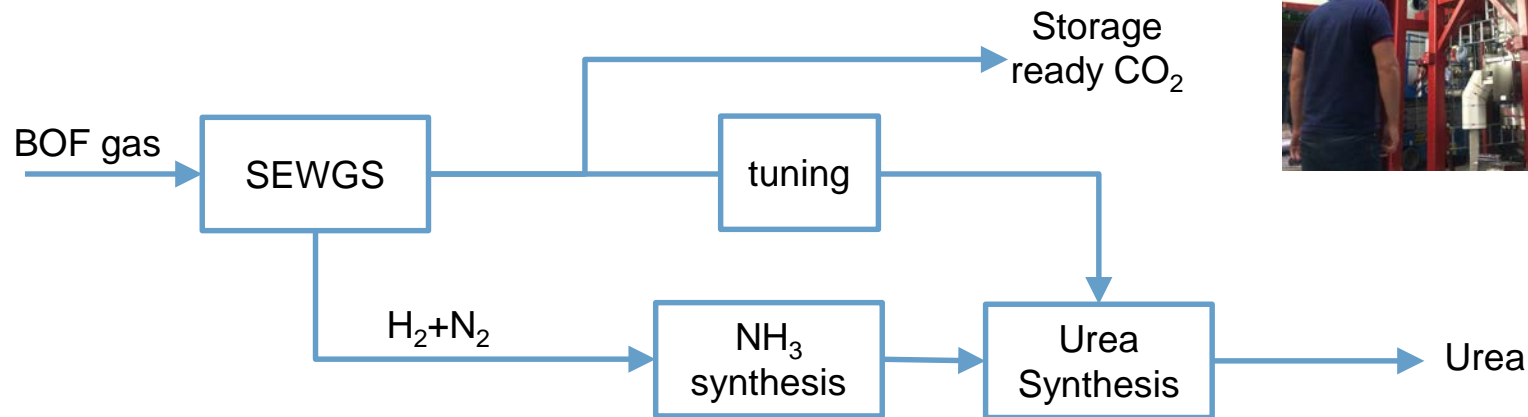

Gas type	CO <sub>2</sub>	CO	N <sub>2</sub>	H <sub>2</sub>	CH <sub>4</sub>	LHV (MJ/Nm <sup>3</sup> )
BFG	22	22	49	4	--	3.2
BOFG	14	57	14	3	--	7.5
COG	2	5	7	62	24	15.3

10Mt/year Iron&Steel Mill, see IEAGHG report on Iron&Steel,  
[http://www.ieaghg.org/docs/General\\_Docs/Reports/2013-04.pdf](http://www.ieaghg.org/docs/General_Docs/Reports/2013-04.pdf)

BFG – Blast Furnace Gas  
 BOFG – Basic Oxygen Furnace gas  
 COG – Cokes Oven gas

# ENERGY TO VALUE ADDED CHEMICALS

- › Currently energy is used for electricity production
- › After STEPWISE technology
  - › N<sub>2</sub> goes with the H<sub>2</sub>
  - › Treated BOF gas has the right H<sub>2</sub>/N<sub>2</sub> ratio for ammonia synthesis

## BUSINESS CASE

- › Comparable economics for natural gas based and BOF-gas based urea
- › Urea pays for capture technology, storage ready CO<sub>2</sub> as side product

# LIFE CYCLE ANALYSIS

- › Global Warming Potential (GWP) reduction of ~13% without CO<sub>2</sub> Storage.
- › 70% CO<sub>2,eq</sub> avoided if deployed with storage and transport.
- › Electricity consumption is the primary source of remaining CO<sub>2,eq</sub>.

› THANK YOU FOR YOUR ATTENTION

Carbon Copy is a show about the technology, engineering and economics of a low carbon future. Join host, Dr. Mark Summers, as he dives into the topics and technology innovations that are critical to delivering sustainable environmental outcomes, attracting investment, and building a diversified, lower carbon economy. Carbon Copy, a new podcast from ERA, takes a closer look at the technologies and people that will change our climate impact and help reshape Alberta's economy.

**Appendix 4:**

Presentations from group work sessions (slides)

Trondheim Workshop,  
June 19-20

Topic no: 1  
Decarbonizing industry sectors

# 1. Which opportunities are identified from an industrial point of view?

- CCUS is the only current mature technology able to dramatically reduce process CO<sub>2</sub> emissions. Opportunity for deep reduction (net zero emissions) by BECCS.
- “Waste heat” available for the CO<sub>2</sub> capture system: integration of the production & consumption of heat/steam/energy between the production facility and the CO<sub>2</sub> capture unit. Industry offers an opportunity for partial capture at moderate cost
- Flexibility on getting tailored CO<sub>2</sub> capture systems based on the site/region specifications
- Starting with the “low hanging fruit”: capturing the “easy” CO<sub>2</sub>, higher concentration emissions. Opportunity to scale-up by CO<sub>2</sub> will demonstrate economic benefits.
- Wide varieties of CO<sub>2</sub> capture technologies. Opportunity to tailor those to the flue gas/facility. Some knowledge transfer from the power sector to the production facilities, and stimulating dialog, learning from the past mistakes/success
- Solids looping technologies may play a role integrated in the cement production emissions.

## 2. How do we most effectively get from research to commercial product?

- Database that contains the successes and failures of projects
  - Where did the pathway fail and why? Early risk identification
  - Can we make use of existing databases and build upon those?
- Starting on the learnings from the power sector or existing plants: available space, available waste heat. Business model analysis. Flexibility on the electricity grid and/or base load following renewable energy
- Build larger demos and test centers for other industrial emissions
- Appropriately sizing pilots and demonstration – often based on available funds?
  - Evaluating the need and the success/failure metrics
  - Starting with the learnings, and tailoring the systems to the specific facility
- Incremental scale-up by CO<sub>2</sub> emissions sources in the production plant or by size

## 2. How do we most effectively get from research to commercial product?

- Knowledge sharing and openness, from academia to private partners.  
Joint activities
  - Data sharing of all commercial processes, international test center network (including visiting facilities), ACT, harmonizing data, standardization and building plants for different industrial sources.
- IP-sharing: challenging task, that is the bread and butter of the vendors
- At long term: Recognize regulation/standards is important
  - Not wait for unicorn technologies, try to shorten time for construction and operational permits

# Iterative learning process before scaling-up

### 3. What joint activities could be established to accelerate deployment?

- Public engagement in parallel with technology development, facilitate championing CCS plants in operation
- Educating non-conventional stakeholders
- Social engineering: encouraging people to buy low-CO<sub>2</sub> footprint products (consumers will drive the market price)
- Standards (in the long term), incentives or market pull
- Transfer knowledge and business models from operating plants to other industry, and from one plant to another
- Joint effort on consistent requirement for reporting on successes and failures
- Making use of development banks, linking construction opportunities with financial institutions, a gap exists between the two groups

### 3. What joint activities could be established to accelerate deployment?

- At early stages we have a lot of governmental support, students and universities
  - Difficult to get support at higher TRLs, when you have to test at scale (TRLs 4-8 are the valley of Death!)
- We need to learn how DeSO<sub>x</sub> and deNO<sub>x</sub> became a commercial success with lower costs through just building plants with engineering improvements.
- Global governments need to share incentives for CCS

### 3. What joint activities could be established to accelerate deployment?

- Existing financial structures: Revenue models, risk management, funding, capital & ownership need to be shared openly
- Business cases – who can offer which services? Multiple stakeholders in different industry sectors
- 45Q market pull
- Interaction between industries (e.g. H<sub>2</sub> production with steel or chemicals production)
- Increase on production cost assumed along the final product chain
- Joint procurement commitment, involving government procurement

### 3. What joint activities could be established to accelerate deployment?

- International partnership, learning from projects and other industries, what works where → brings down risks, attracts investors and the public, and keeps them
  - Trying to get more partners and countries into fewer centres of excellence!!
  - Communicate our failures and how problems were solved, highly valuable!
  - Engage with the financial industry
- Sharing liability and risks to help technology progress in capture and storage
- Creating a backbone CO<sub>2</sub> infrastructure, a public good! Opportunity of clusters and hubs
- Evolving roles of public-private partnerships. As the projects and infrastructure evolves, the public partnership might have a smaller role and the market will take over

Trondheim Workshop,  
June 19-20

Topic no: 2

The role of CCS in enabling clean hydrogen

# Questions to be discussed under each topic:

1. Which opportunities are identified from an industrial point of view?
2. How do we get most effectively from research to commercial product?
  - a. What steps are needed?
3. What joint activities could be established to accelerate technology development and implementation?
  - a. How can joint action accelerate deployment?
  - b. Business models: What funding instruments are/could/would be effective?
  - c. Mobilizing national efforts towards international efforts
  - d. Public-private partnership, co-funding

# 1. Opportunities from Industrial point of view

- Overarching opportunity: Need to decarbonise!
- Specific opportunities:
  - Heavy duty transportation
  - High temperature heat – difficult to electrify
  - Reducing agent – feedstock for industry
  - Energy storage
  - Climate positive from biomass with CCS
  - Both CO<sub>2</sub> and H<sub>2</sub> could be a feedstock (EOR..)
- At the moment, H<sub>2</sub> with CCS has a lower carbon footprint and cost than H<sub>2</sub> from electrolysis
- Can avoid shipping CO<sub>2</sub>, ship H<sub>2</sub> instead – avoid London protocol

# 1. Opportunities from Industrial point of view

- Re-use of existing infrastructure
- Re-use existing competence
- Magnum, H21, H-Vision (Rotterdam)
- There is no 'one size fits all'

## 2. From research to commercial product - *effectively*

- Successful innovations need many factors for their success (M. Hekkert)
- Demonstrations will only happen when all these functions develop

Seven functions, that are all needed to make the innovation successful

F1 Entrepreneurial experimentation

F2 Knowledge development

F3 Knowledge exchange

F4 Guidance of the search

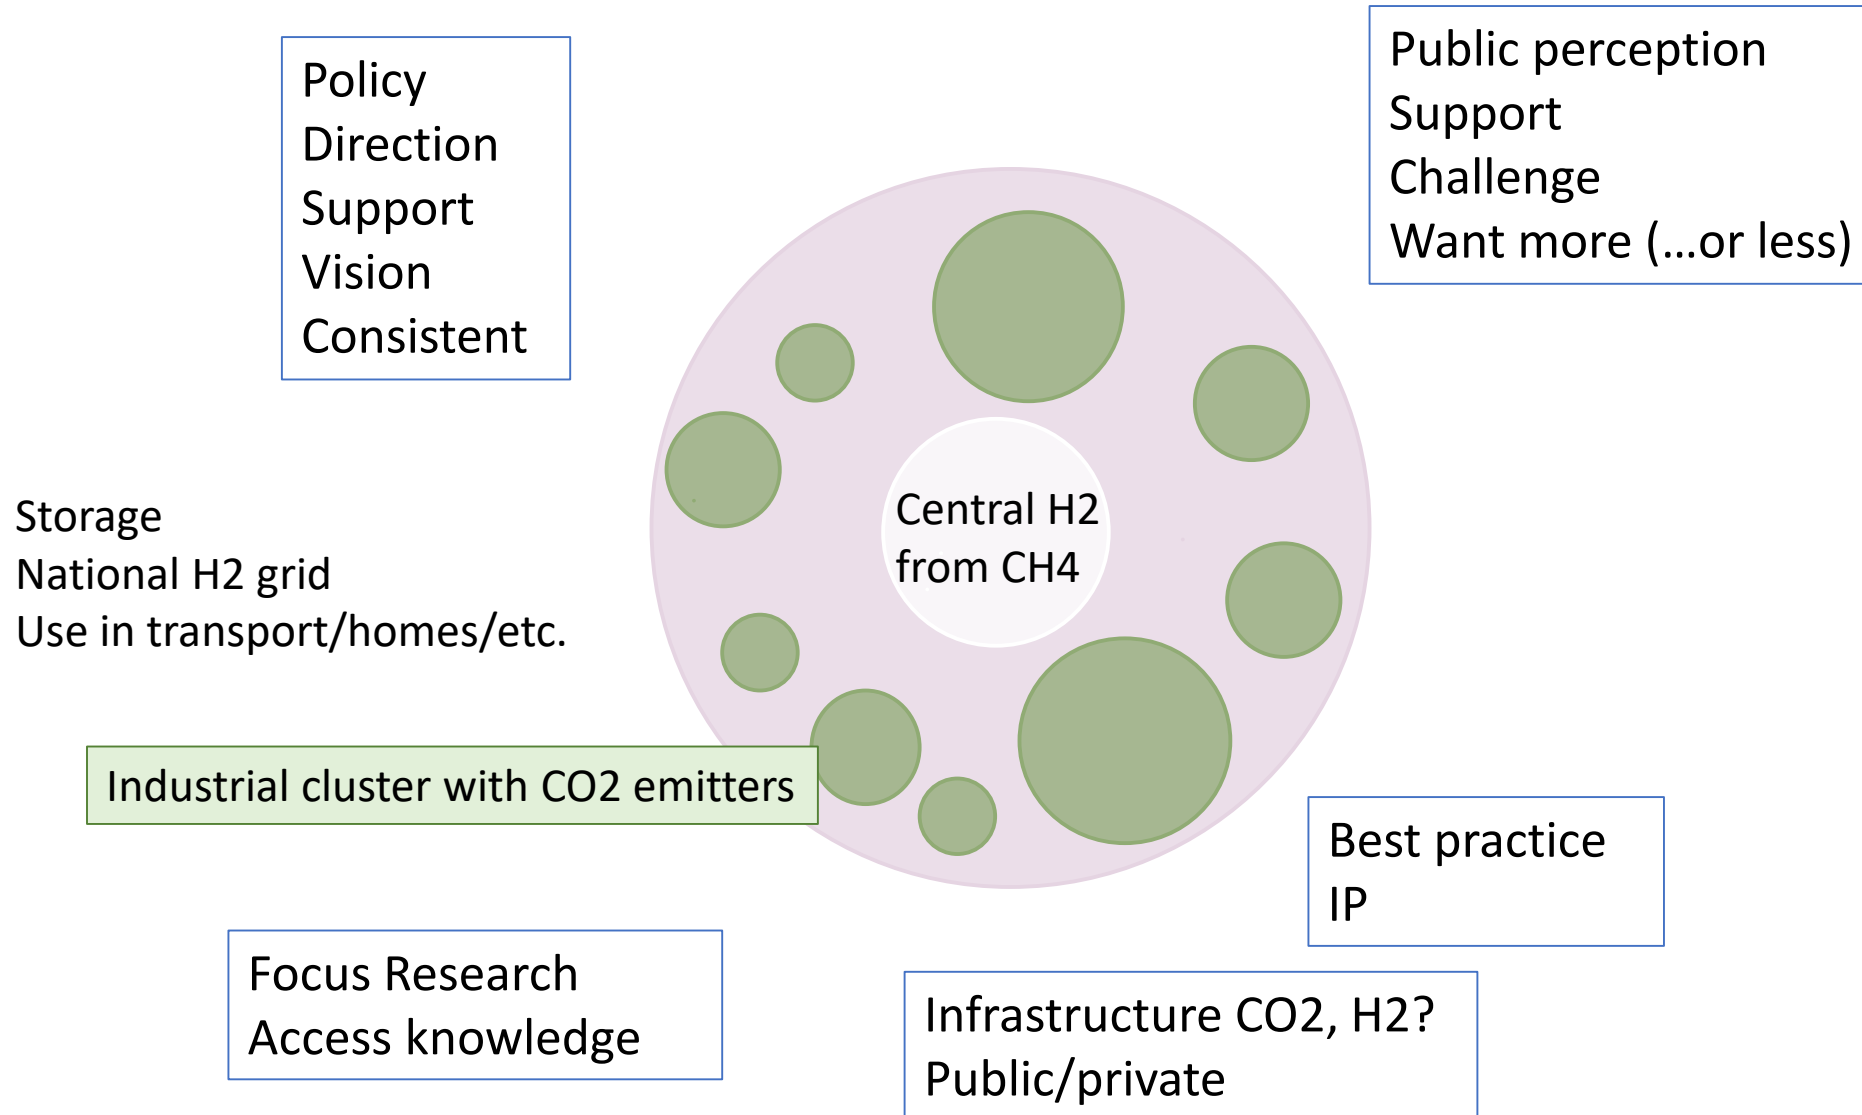

F5 Market formation

F6 Resources mobilisation

F7 Legitimacy creation

Prof. Dr. Marco. Hekkert, Utrecht University, is working on innovation system analysis. There are various publications that explain the seven functions for innovation.

## 2. From research to commercial product

## 2. From research to commercial product

- Thinking the whole value chain – master complexities, inform choices
- Go for large scale: impact, well-informed
- Go for small scale: room for experiments, quick decisions, niches
- Academia should inform discussions
- ‘Middlemen’ are needed to link the chain
  - Suggest opportunities
  - Industrial symbiosis

## 2. From research to commercial 'product' - *Effectively*

- Value chain demonstrations
- Knowledge sharing
- In absence of clear CO2 regulation or a clear price for CO2 emission - Government funding – consistent in time – and international level playing field
- International cooperation on test centre, 'TCM for hydrogen'
- Regulation to mandate low carbon content
- Encourage international collaboration and joint industry projects
- Vibrant market for technology vendors
- Encourage industry clusters

## 2. From research to commercial 'product' - *Effectively*

- Supporting policies and regulations for use of H<sub>2</sub> produced with CO<sub>2</sub> capture
- Honest about safety
- Demonstration projects should consider
  - Capture rate
  - Energy requirement, purity of CO<sub>2</sub>, liquefaction CO<sub>2</sub> etc.
  - Opportunity for energy storage, H<sub>2</sub> or NH<sub>3</sub>
  - Public acceptance

# 3. Accelerating implementation

- *Integrated in discussion of questions 1 and 2!*

Trondheim Workshop,

June 19-20

Topic no: 3

CO2 storage & networks

# 1. Which opportunities are identified from an industrial point of view?

- Large-scale CO<sub>2</sub>-storage creates enormous business potential
  - Technical knowhow is there (e.g. O&G), but perception issue
  - Opportunities for new business/companies, incl. independent assessment bodies
  - Motivated young people, green topics, open (publishing)
  - Added value by/for complementary activities (water production, EOR, energy production and storage)
- Quantify project risks and benefits
  - Risk quantification; injection wells and legacy wells
- Digitalization / big data applied to CO<sub>2</sub> storage & transport/networks
  - Sharing of data, knowledge
  - Machine learning
- Develop cost-effective storage and transport hub systems

## 2. How do we get most effectively from research to commercial product?

- Projects at scale beyond lab: field projects, pilots, real projects
  - Technology development/testing
  - Additional role: public perception role, local technology demonstration
- Mature R&D technologies in specific fields: \*pressure management, \*fault & fracture risk, \*well integrity, \*resource optimization/mobility control, \*pipeline fracture propagation, \* network & hubs planning tools
  - Many of them need pilots/demos, application in full-scale projects
- International cooperative project «International Earth Geonome project» (like Biogenome project, Space station, IODP)
  - Mapping national storage resources similarly to other resources
  - Big international test site
- «MI project» twining idea – 2 or more countries together on specific projects (technology development, pilot & demonstration)
- Transparency / openness
  - Proactive communication on risk and mitigation (NASA approach), balance with info on benefits
- Regulatory rules

### 3. What joint activities could be established to accelerate technology development and implementation?

- Data sharing and using international digital platforms
  - Stimulate data sharing by public incentives (e.g. tax)
- MI Platform for sharing stories, knowledge and case studies
  - Better use of existing technical knowledge
  - Facilitates public communication and risk quantification
- Engage with insurance industry in building confidence in storage
- Maturation of international certification process for bankable storage resource
- Standardization of terminology and processes
- Establish internationally recognized CO2 storage software (open source)

# PRDs

- Advancing multiphysics and multiscale fluid flow to achieve capacity
- Understanding dynamic pressure limits for GT-scale CO<sub>2</sub> injection
- Optimizing injection of CO<sub>2</sub> by control of the near-well environment
- Developing smart convergence monitoring to demonstrate containment and enable storage site closure
- Realizing smart monitoring to assess anomalies and provide assurance
- Improving characterization of fault and fracture systems
- Achieving next-generation seismic risk forecasting
- Locating, evaluating, and remediating existing and abandoned wells
- Establishing, demonstrating, and forecasting well integrity

# Questions to be discussed under each topic:

1. Which opportunities are identified from an industrial point of view?
2. How do we get most effectively from research to commercial product?
  - a. What steps are needed?
3. What joint activities could be established to accelerate technology development and implementation?
  - a. How can joint action accelerate deployment?
  - b. Business models: What funding instruments are/could/would be effective?
  - c. Mobilizing national efforts towards international efforts
  - d. Public-private partnership, co-funding

Trondheim Workshop,  
June 19-20

# Topic no: 4 Storage Monitoring

Monitoring Verification and Performance Metrics

# Agenda of Subpanel Workshop

- Context setting by the chair– 30 min
- Divide into groups to discuss topics- 1.5 hours
  - Introductions –country and expertise
  - Choose a group chair/reporter
  - Refine the topics enough to answer the questions
  - Put ideas on a PowerPoint presentation
- Lunch – 45 min
- Plenum to report/integrate ideas for reporting – 1.5 hours

# Given that...

- Regulations require some form of monitoring
- Many tools and techniques have now been tested at demonstration projects
- Technological advances present new opportunities to further improve capabilities
- Challenges are within the context of upscaling, knowing that many projects may operate in close proximity creating large volumes
- Approaches will apply to either deep or shallow zones

taken from the Report of the Carbon Capture, Utilization and Storage Experts' Workshop  
`Storage Panel: Monitoring, Verification, and Performance Metrics, September 2017

# Challenges Outlined in MI 2017 Report (Groups for discussion)

1. Monitoring to demonstrate containment and enable site closure:  
Transforming far-field monitoring with new tools to directly measure state variables
2. Smart monitoring in the far-field
3. Improving methodologies for monitoring plans
4. Improving interpretation and use of large, complex data sets
5. Assessing anomalies and providing assurance – location, attribution, quantification

# Challenges Integrated into 3 Discussion Groups

1. Closure and Far-Field Monitoring to demonstrate containment and enable site closure: Transforming far-field monitoring with new tools to directly measure state variables
2. Assessing anomalies and providing assurance – location, attribution, quantification
3. Well remediation monitoring

# Questions to address under each topic:

1. Which opportunities are identified from an industrial point of view?
2. How do we get most effectively from research to commercial product?
  - a. What steps are needed?
3. What joint activities could be established to accelerate technology development and implementation?
  - a. How can joint action accelerate deployment?
  - b. Business models: What funding instruments are/could/would be effective?
  - c. Mobilizing national efforts towards international efforts
  - d. Public-private partnership, co-funding

# Closure and Far-Field Monitoring

# Identified Industrial Opportunities

- Pilot closure project
  - Goals & approach: identify monitoring plan with minimum cost, evaluate the value of information and monitoring technologies, what is the monitoring system that is most efficient given a site? Highly instrumented, test out the impact of reducing information on evaluating closure; Advance monitoring techs to high TRL
- Learn from existing projects: Ketzin, Tomokomai, Aquistore
- There is an opportunity for a centralized organization to facilitate co-operative activities
- Technologies – There is an opportunity to advance monitoring technologies, both low and TRL, to contribute to site closure
- Research “What if”:
  - Understanding speed limits to CO<sub>2</sub> migration and interaction with the overburden
  - Advance lab to field characterisation technology to provide stronger predictive modelling capabilities
  - Use digital twins to explore unlikely scenarios

# Research to Commercial Product

- Pilot study - Learning by doing with goals to advance the TRL with the site
- Best practices and data shared from regional, national, state, company experiences
- Defining closure: Key question is how do you show that mass evolution has reached stasis; Should be able to discuss with the regulator how risks will evolve in the context of the specific project, e.g., depleted gas field – from the start of project you should also be working towards closure; Need to follow a trajectory where model uncertainty is large at the beginning of the project and narrow later, this is accommodated in Norway where they also are allowed to define their definition of closure, i.e., how will you be able to demonstrate this; There needs to be flexibility for the precise definition, e.g., of conformance, closure, to allow for knowledge gained during the course of a project; Regulatory agencies need to not be fixated on a particular outcome; Requirements for ongoing monitoring conformance and closure are very similar
- How will closure occur? – operators will keep projects going, they will look for opportunities to step out, operators like to be involved in regional development; There are major costs associated with closure; The reasons for, e.g., continuing, developing, closing, are often the result of complicated issues;

# Joint Activities

- Pilot closure project
- Far field - Data sharing and cooperation between neighboring fields Use existing infrastructure in neighboring areas; In the far field; Seismic in the marine environment often pick up each others' signals and operators are interested in this information; Tomography of overlapping data is useful in regional scale . Pressure interference between wells, vertical and horizontal, at scale between projects
- General – learning from experiences; There is a lot that could be learned from, e.g., the Norwegian experience; Onshore and offshore are different beasts – a lot more information onshore, fewer technology options
- Centralized organizations would help to facilitate co-operative activities

# Funding Mechanisms and Business Models

- Evaluate existing models and settings: Norwegian, Canadian, and Texan models – differences in closure definition, data sharing, post-closure liability
- Mobilizing national efforts towards international efforts
- Sharing information – data sharing , benchmarking, collaboratively on same problems
- Large projects with international collaboration, e.g., CaMI
- International R&D funding mechanisms like the ACT project
- Public-private partnership, co-funding
- International R&D funding mechanisms like the ACT project

# Assessing anomalies and providing assurance

# Identified Industrial Opportunities

- Cost effective, confidence, show compliance to regulatory, public acceptance
- Monitoring tools and techniques that can both attribute and quantify leaks – without needing baseline (ref. argument that near surface is so variant)
- Deciding what types of data to collect, to reduce costs and provide assurance
- Third party monitoring? Helps public acceptance...
- Machine learning + process/models understanding
- Utilize wells drilled checking soil conditions before installation – can you put some sensors and information?
- Risk based monitoring; faults and wells
- Deep monitoring to inform shallow monitoring, including overburden characterisation
- Combining physical measurements for locating features with geochemical assessment
- Quantification technologies and approaches

# Research to Commercial

- Tools ready to go – tested.
- Need to have vendors involved in the development
- Funding pre-commercial developments

# Joint Activities

- Access to data – share what is done from projects. Funding to utilize data
- A mechanism to connect researcher with the industrial data set
- Good area model – need exploration data. For example, if there is an area in the North Sea that is identified as storage hub.
- Projects learning by doing – connect funding and R&T to extract learning to broader community
- How do you use large data set and look at anomalies. Bring experts together with AI (Artificial Intelligence). (reference to medical).
- Learn from other fields, health in house treatment of data

# other (messy) notes

- Moving away from baseline monitoring...
- Assessing anomalies - Combining data to look for anomalies
- Bow tie risk assessment
- We have set up the expectation very high – ten times more than O&G. Post operation monitoring...
- Need a good risk analysis and understand where the risk are for CO2 leakage – and monitor these
- Everybody feel safe that CO2 is stored in three – but nobody care if the three is felt...
- Hard to put properties on faults... micro seismicity
- How can we integrate the monitoring in the deep surface with what we do at the seafloor.....
- Design the seafloor monitoring? Governed by the risk
- New types of technologies that can help design risk based and cost-efficient seafloor monitoring
- Characterization of overburden
- Shearwave good for the shallow – pockets of gas.
- Instrument that can find chimneys acoustically
- Monitoring work-flow – what informs what ----
- Process-based approaches

# Monitoring legacy well integrity and intervention

# Identified Industrial Opportunities

- Leakage from **legacy wells**/faults/reservoir-containment presents a high risk
- Remediation/intervention procedures need to be established for licensing, public assurance/education, and actual intervention
- Remediation need to address leakage from legacy wells and containment, and how to deal with different levels in subsurface to the surface remediation (impact on the ecosystem, social perception, impact ...)
- Define thresholds (when and how to intervene (and when **not**) )

- Identifying legacy wells in the injection site (in both HC fields and aquifers) (**technology gap**)
  - Establishing procedures for well integrity testing for CO2 integrity (certification) for “enough” period of time. Risk assessment of legacy wells
  - Legal/regulatory/spatial planning context
  - Establishing remediation procedures (how to fix risky wells)
  - Developed technologies for the above points depends on well types (offshore (deep, shallow water), onshore, vertical, horizontal ,...)
  - Deal with associated uncertainty
  - How to manage the cost overhead
  - Data availability from data owners/ transparency

- **Containment-leak remediation (active-passive methods)**
- Risk from “surprise” faults. Surprise faults are small-mid size faults that could be below the imaging resolution (technology improvement opportunity).
  - How to deal with leaky faults/fractures => currently immature technology (use cement, gel, polymers, foams, .... Issues related to effectiveness and durability)

## ➤ **Social responsibility**

- Liability (short term?, and long term?)
- Communication to public (ownership)
- Private-public-government commitment
- Establish specialized governmental agencies to respond to leak emergencies (establish procedures, recommendation)
- Lesson-learned from the failures/successes in the O&G

## Joint Activities

- Partnership between stakeholders(companies, states)
- MI to establish an **A-Team**, to advise/intervene when needed
- MI to establish an advisory “peer-review” panel to help “certifying” CCS projects

Trondheim Workshop,  
June 19-20

Topic: Going Climate Positive!

# Going Climate Positive!

- Tech is here- resource issue
  - Biomass – renewable power – and how about sustainability
- Need a R&I agenda on a global scale- lacks on national scale
- Need to demonstrate CPS!
- Buisness models
- Rising atmospheirc CO<sub>2</sub> imposes a societal cost, removing is a public good, the public remuneration of that is reasonable

# Questions to be discussed under each topic:

1. Which opportunities are identified from an industrial point of view?
  1. Biomass and secondary biomass (conventional and unconventional)
  2. Early adaptors- scaling an issue for for instance DAC(S)
  3. Maximising the value of the biomass resource
    1. Energy to CDR

# Questions to be discussed under each topic:

2 How do we get most effectively from research to commercial product?

- Global resource stocktake (terrestrial and marine)
- Algae and marine biomass important – maximizing yield and value
- Recognizing the cost of carbon- account for damages

# Questions to be discussed under each topic:

3. What joint activities could be established to accelerate technology development and implementation?

- Importance of knowledge sharing and standardization, best practices
- Leveraging R&I co-operation- global broker for climate positive solutions-accounting
- Cost of carbon consumption and scaling up
- No one fits all!- regional and even local solutions will have to play out
- Leveraging and managing consumer purchase power
- Certification and standardization of Climate positive

Trondheim Workshop,  
June 19-20

Topic no: 6  
Utilization

# Questions to be discussed under each sub-topic:

1. Which opportunities are identified from an industrial point of view?
2. How do we get most effectively from research to commercial product?
  - a. What steps are needed?
3. What joint activities could be established to accelerate technology development and implementation?
  - a. How can joint action accelerate deployment?
  - b. Business models: What funding instruments are/could/would be effective?
  - c. Mobilizing national efforts towards international efforts
  - d. Public-private partnership, co-funding

# Utilization : sub-topics

- **Fuels/chemicals/plastics**
- **Mineralisation/ building materials**
- **CO<sub>2</sub>-EOR**
- **Markets and thermodynamics**

# Sub-topic: Fuels/chemicals/plastics

- Source CO<sub>2</sub> matters: CO<sub>2</sub>-products (as chemicals, fuels, plastics) will produce again CO<sub>2</sub> ending up in atmosphere so no GHG mitigation (50% max reduction regards of substitution to fossil products)
- Local potential ( niche, small market): interesting for business but not mitigation tool -> will never reduce global emissions (*however no clear consensus on this point : CCU could participate in the reduction of CO2 emissions but never substitute CCS*)
- Mid-term/long-term should be considered for the selection of CCU technologies
- CO<sub>2</sub>-fuels : could be the best case for certain sectors (aviation, marine)

# Sub-topic: carbonatation

- Advantages: it is a G-ton market and it is not disruptive (no changes of the technologies)
- Scale up issue: standardisation could help to overcome it
- Need a clear differentiation between the sequestration time of CO<sub>2</sub> in the product and the CO<sub>2</sub> quantity embedded -> set up a label
- Need incentive because cost penalties for mineralisation as tax credit
- Aggregates: flues gases could be used directly (synergy between carbonatation and industries, eg: proximity)
- Need RD: more pilots to assess/ improve the technologies of mineralisation
- Mechanism to harmonize assessment for comparison of products or sources of CO<sub>2</sub>
- Legislation issue: waste could be used in carbonatation process but some countries as Germany/France do not allow to use it as raw materials: how to demonstrate safety of these products ?

# Sub topic: CO<sub>2</sub>-EOR

- The main need for RD is about expanding storage capacity: switch from optimisation of oil/gas extraction to CO<sub>2</sub> storage
- No incentive should be given (*consensus from the whole group*) -> governments should regulate/ set up a clear framework to communicate on it as a label (?)
- Only low TRL should be considered for national support : need to improve technology at large scale for sustainability (both economic and sustainability)
- Main advantage : facilities already exist (wells, infrastructure,...) -> good opportunity to demonstrate CO<sub>2</sub> storage
- Main disadvantage: fossil fuels should be stopped and CO<sub>2</sub>-EOR could increase the production *however* fossil fuels are needed during the energy transition and good opportunity for Oil/Gas companies to improve image -> need to communicate why fossil fuels are still needed
- Technology already at commercial scale: proven technology/mature and acceptable in US for energy security and to substitute the use of geological CO<sub>2</sub> by anthropogenic CO<sub>2</sub>
- Other opportunity: reduce impact by reusing mature field instead opening new field

# Sub topic: Market-thermodynamics

- Concern about market mismatch and thermodynamics:
  - Too much CO<sub>2</sub> than the need from the market
  - Thermodynamic challenges for most CCU routes: CCU technologies require more energy in than out
- CCU is one part of the solution: not a silver bullet but should not be discarded
- **Importance of LCA and TEA** for identifying the most promising CCU routes
- Market opportunities: already identified but need to be updated (market evolves)
- Different size of opportunities: all routes should be investigated even for niches
- Assessment: boundaries are very important- linking to the sources (CO<sub>2</sub>/H<sub>2</sub>) to focus on opportunities with high potential of GHG reduction (limited investment)
- Opportunities and benefices: existing chemicals industries could developed new processes through CCU if the market is right through CO<sub>2</sub> tax or regulations
- Synergy between industries (CO<sub>2</sub> sources) and CCU routes: same location (possibility or use directly flue gases), availability of resources (heat, waste,...)
- Better public acceptance of CCU (contrary to CCS): can be used to broaden a public acceptance for CCS if synergy between CCU and CCS.
- Common barrier for CCU and CCS: capture (even if it is not the same scale)
