

The GATEWAY project

The H2020 GATEWAY (2015-2017) project aims to develop a comprehensive **model Pilot Case** which, intentionally, will **pave the ground for CCS deployment in Europe**. It will result from the assessment of, technical, commercial, judicial and societal issues related to a future CO₂ transport infrastructure.

So far, four potential pilot cases have been evaluated through a combination of techno-economic modelling of the individual cases and evaluation against more qualitative criteria. The chosen Pilot Case, **Rotterdam Nucleus**, will be refined and developed during the remaining period of the GATEWAY project.

To maximise impact, the GATEWAY project adapts its work to lay the foundation for an application to a European **'Project of Common Interest'** (PCI).

We are actively seeking **stakeholder contributions** - contact us if you have input you would be willing to share!
