

# A future energy chain based on liquefied hydrogen

David Berstad, Jacob Stang, Petter Neksa  
SINTEF Energy Research

Oct 22<sup>nd</sup>, 2009

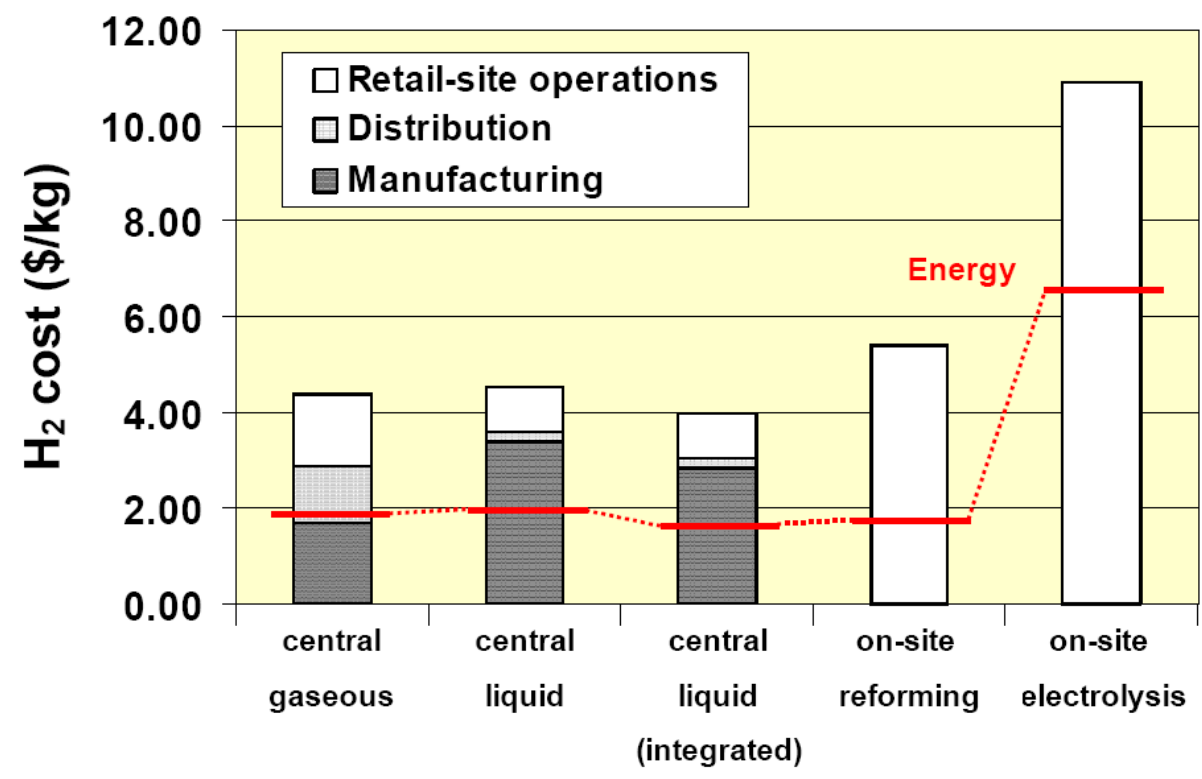

1st Trondheim Gas Technology Conference

# Outline

- Introduction to the role of liquefaction in an energy chain with hydrogen as energy carrier
- Comparison of existing and proposed conceptual hydrogen liquefiers
- Selection of a high-efficiency case for the following tasks:
  - Replacement of original pre-cooling of hydrogen to 75 K with a new pre-cooling cycle based on mixed refrigerant (MR) technology
  - Investigate the consequences of this modification with respect to power consumption and process efficiency
- LH<sub>2</sub> in relation to LNG
- Conclusions and further work

# Previous Shell study on hydrogen well-to-wheel <sup>1</sup>

- Early-phase scenario: reforming of methane, CO<sub>2</sub> capture and bulk transportation of hydrogen from production site to retail site
- Liquid hydrogen (LH<sub>2</sub>) vs. compressed gaseous hydrogen (CGH<sub>2</sub>)

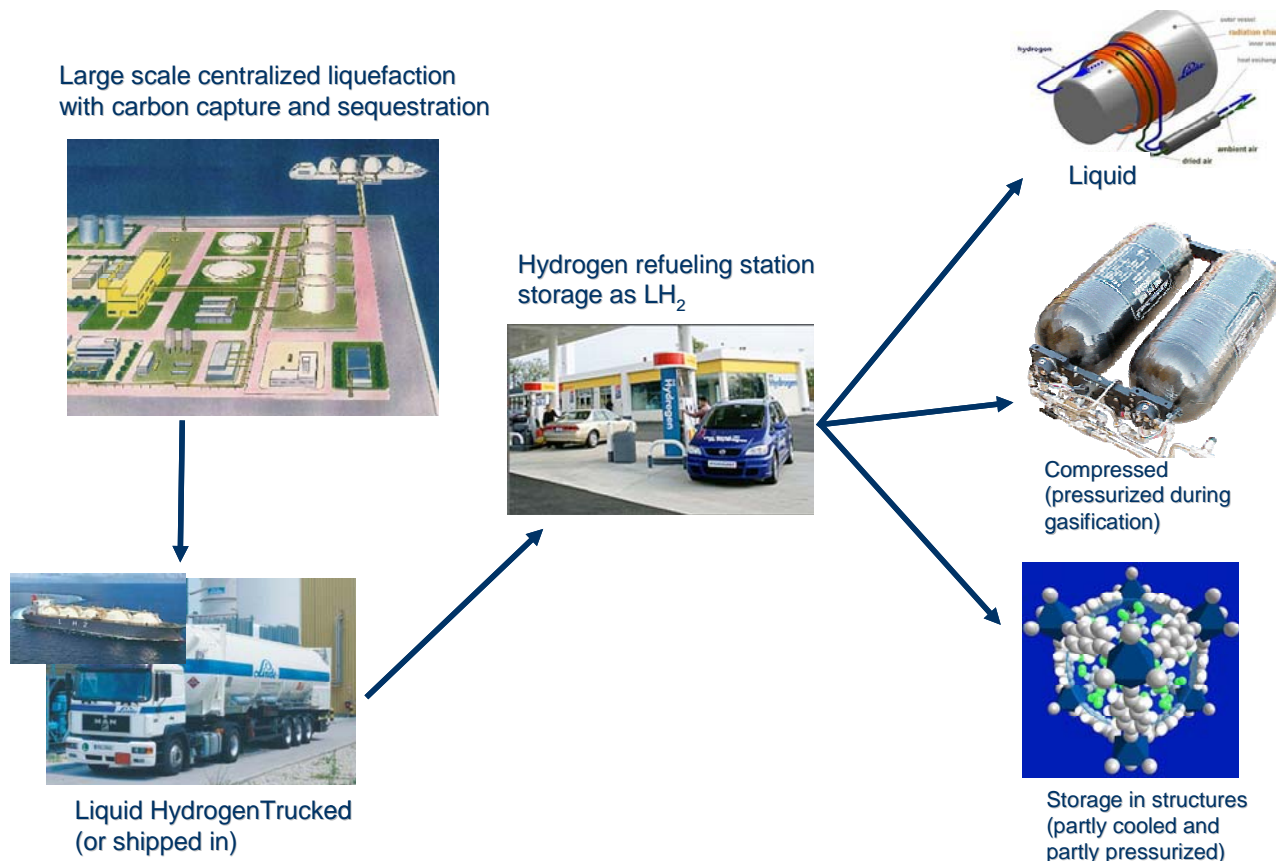

Assumed specific liquefaction power for LH<sub>2</sub>: 10 kWh/kg<sub>LH<sub>2</sub></sub>  
 Average distribution distance: 75 km  
 Production volume: 100 tonnes/day  
 Number of retail sites: 100  
 LH<sub>2</sub> transport capacity: 3500 kg/truck  
 CGH<sub>2</sub> transport capacity: 350 kg/truck

<sup>1</sup>Kramer G.J., Huijsmans J.P.P. and Austgen D.M. *Clean and green hydrogen*. 16th World hydrogen energy conference, 2006

# Advantages of LH<sub>2</sub>

- Flexibility – With close to equal overall cost, LH<sub>2</sub>-based distribution enables delivery of hydrogen in any form with low energy consumption at retail-side filling stations
- CGH<sub>2</sub> does not offer this flexibility without on-site refrigeration

# Transition from current LH<sub>2</sub> production

	Existing liquefiers	Envisioned future liquefiers
Market	LH <sub>2</sub> for specific industrial purposes	LH <sub>2</sub> as an energy commodity
Plant capacity	4.4 tonnes/day (Ingolstadt, 1992) <sup>1</sup> 5.0 tonnes/day (Leuna, 2007) <sup>2</sup>	Significant scale-up in capacity (50–100 tonnes/day or more)
Specific liquefaction power consumption	13.6 kWh/kg (Ingolstadt) <sup>1</sup> 11.9 kWh/kg (Leuna) <sup>2</sup> (10 kWh/kg used in Shell study)	Considerably lower due to higher emphasis on energy efficiency, scaling-up advantages and shifted cost structure
Operation	Flexible operation (Leuna: 40–100% load range)	Large base-load plants with high efficiency at full load

# Selecting a reference case for our work

- The concept by Prof. Quack<sup>1</sup> (2001) is the most efficient concept published – we have therefore based our work on this concept and using it as reference process
- Changed assumptions of the reference process to be more conservative than in original configuration:
  - For pre-cooling to 220 K, the original 3-stage propane cycle is replaced with 2-stage propane + single-stage ethane refrigeration cycles
  - Assumed 21 bar feed pressure instead of 1 bar
  - Inter-cooler temperature in compressor trains: 310 K
  - Implemented pressure drop in all heat exchangers and inter-coolers
  - Minimum temperature approach (MTA) in heat exchangers:
    - Above 235 K: MTA = 3 K
    - Below 235 K: MTA = 2 K
- Liquefaction capacity: 86 tonnes/day (~ 1 kg/s)
- Resulting exergy efficiency: 45.7%

# Implementing mixed refrigerant pre-cooling in the reference case

## Utilities in the different temperature intervals

Liquefaction process modified with MR pre-cooling

# Power figures and overall results

	Reference case	Modified MR case with J-T expansions	Modified MR case with liquid expanders
	Electric power [MW]	Electric power [MW]	Electric power [MW]
He/Ne compression	23,139	14,867	14,869
H2 feed compression	2,401	2,401	2,401
Propane-ethane/MR compression	0,732	7,392	6,330
H2 flash-gas compression	0,043	0,043	0,043
<b>Total compression power</b>	<b>26,315</b>	<b>24,703</b>	<b>23,643</b>
He/Ne expansion	3,443	1,271	1,271
H2 liquid expansion	0,086	0,086	0,086
MR expansion	0	0	0,085
<b>Total expansion power</b>	<b>3,529</b>	<b>1,357</b>	<b>1,442</b>
<b>Net power consumption</b>	<b>22,786</b>	<b>23,346</b>	<b>22,201</b>
<b>Specific power consumption [kWh/kg]</b>	<b>6,33</b>	<b>6,49</b>	<b>6,17</b>
<b>Exergy efficiency</b>	<b>45,7 %</b>	<b>44,6 %</b>	<b>46,9 %</b>

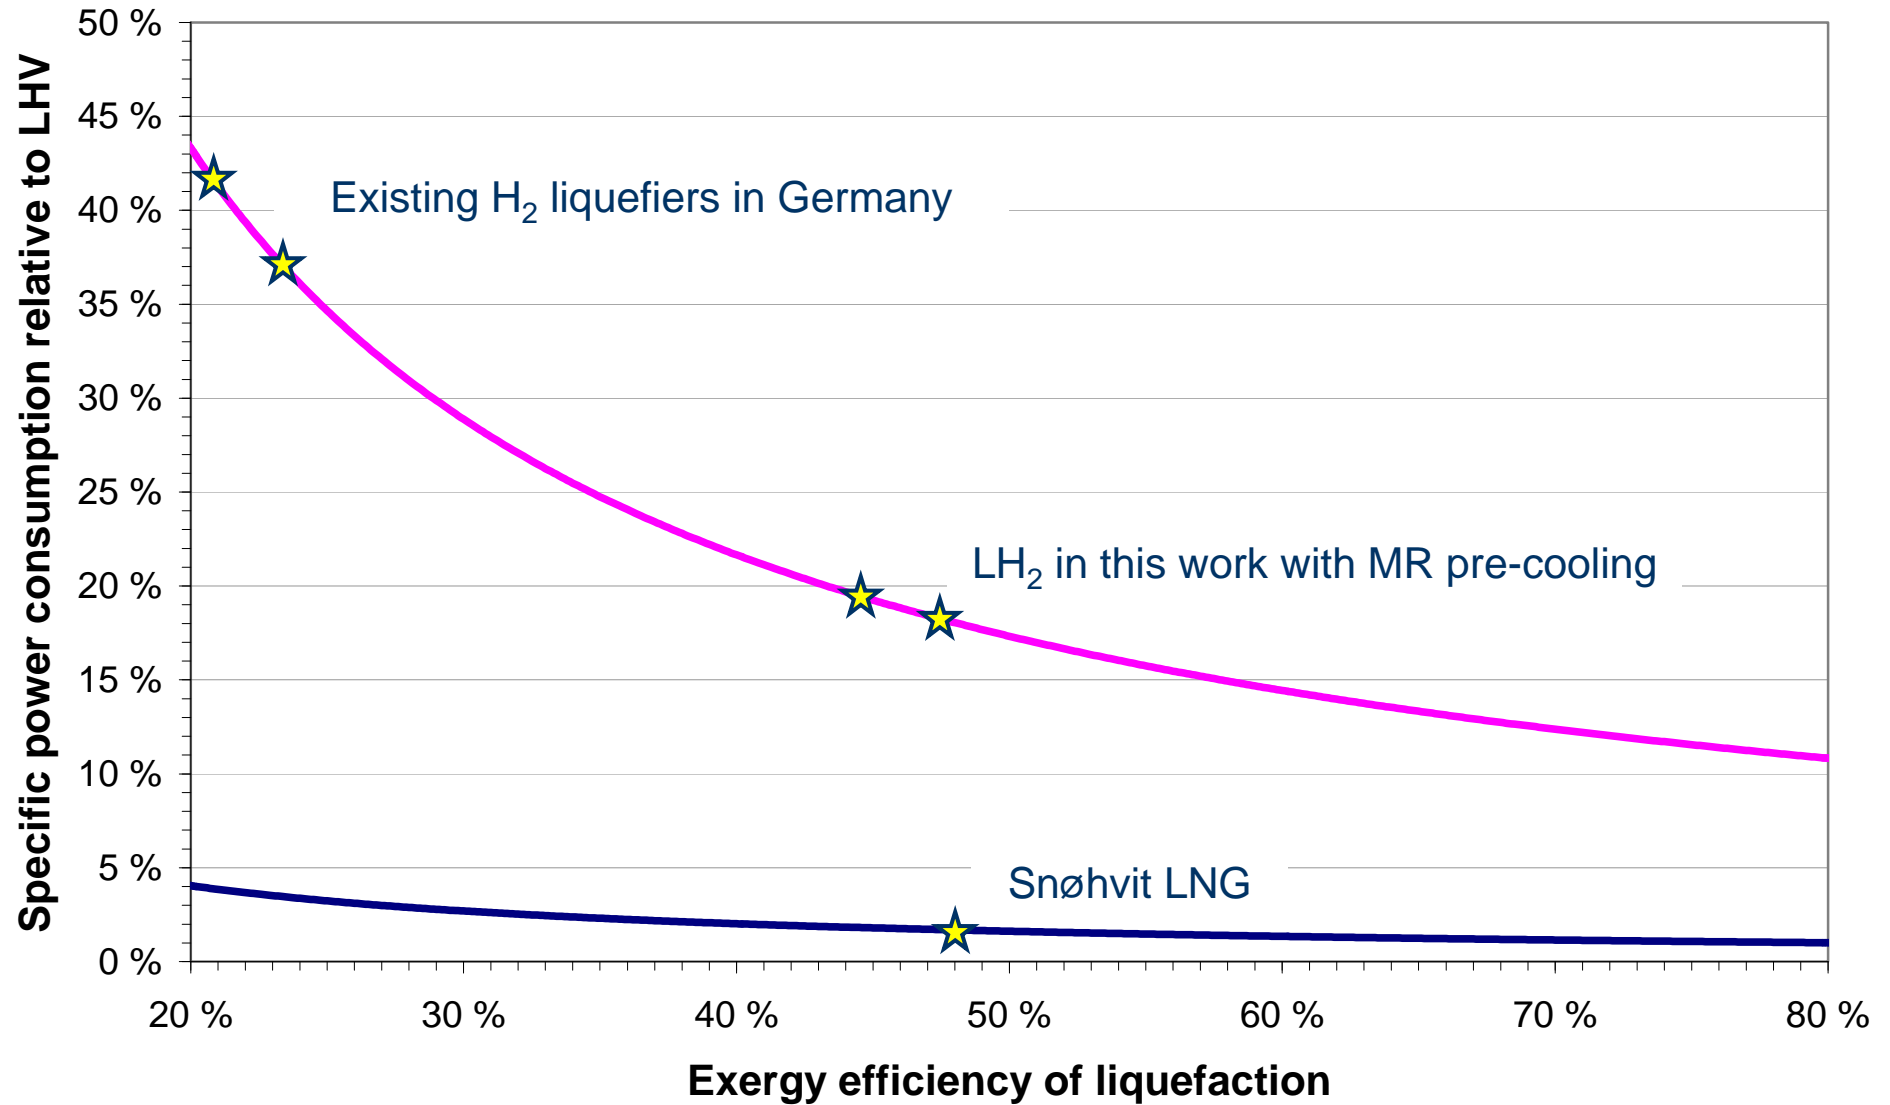

- Replacement of J-T valves with rotating liquid expanders (85% isentropic efficiency):
  - Reduces MR HP/LP ratio from 22.4 to 12.4
  - Reduces MR compression power by 17%

# LH<sub>2</sub> related to LNG

- Lower heating value:
  - LNG: ~13.6 kWh/kg (~49 MJ/kg)
  - LH<sub>2</sub>: 33.4 kWh/kg (120 MJ/kg)
- Reversible liquefaction power (specific):
  - LNG: 0.11 kWh/kg (Snøhvit gas, Hammerfest conditions)
  - LH<sub>2</sub>: 2.89 kWh/kg (21 bar feed pressure, 300 K ambient temperature)
- The Snøhvit LNG plant:
  - Specific design power consumption: 0.23 kWh/kg<sup>1</sup>
  - Exergy efficiency: ~48%
- The best-performance LH<sub>2</sub> process with MR pre-cooling:
  - Specific design power consumption: 6.17 kWh/kg
  - Exergy efficiency: ~47%

<sup>1</sup>Heiersted R.S., Lillesund S., Nordhasli S., Owren G. and Tangvik K. *The Snøhvit Design Reflects A Sustainable Environmental Strategy*. Conference paper, LNG-14, Qatar, 2004.

# LH<sub>2</sub> related to LNG

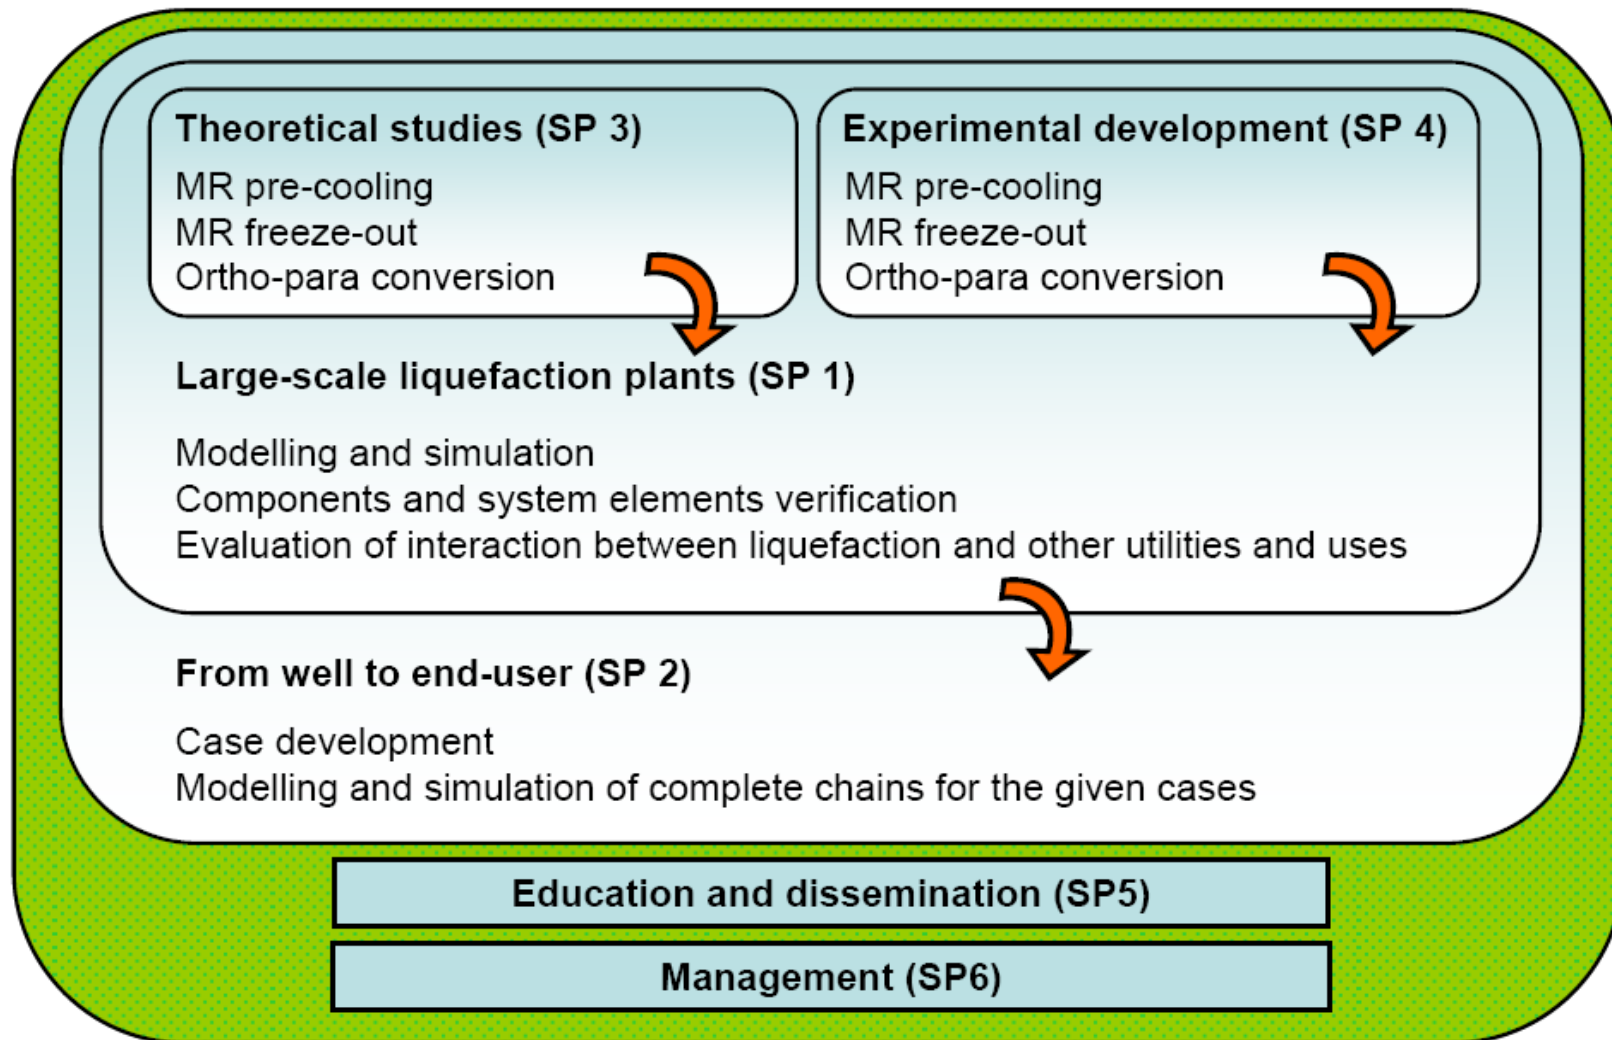

# Conclusion

- The LH<sub>2</sub> processes employing MR pre-cooling show a specific power consumption of 6.17–6.49 kWh/kg and exergy efficiency of 44.6–46.9%
- 40–50% reduction of power consumption, down from 12 to 6–7 kWh/kg, will represent a radical improvement within large-scale hydrogen liquefaction and contribute to further enhancement of the competitiveness of LH<sub>2</sub> as energy carrier in an hydrogen-based energy chain
- As for LNG, MR pre-cooling may play an important role in the efforts towards efficient large-scale liquefaction processes
- High exergy efficiency is desired and may be obtainable for large-scale liquefiers with energy optimisation, extensive process integration and high-efficiency compressors and expanders
