Edition 2006

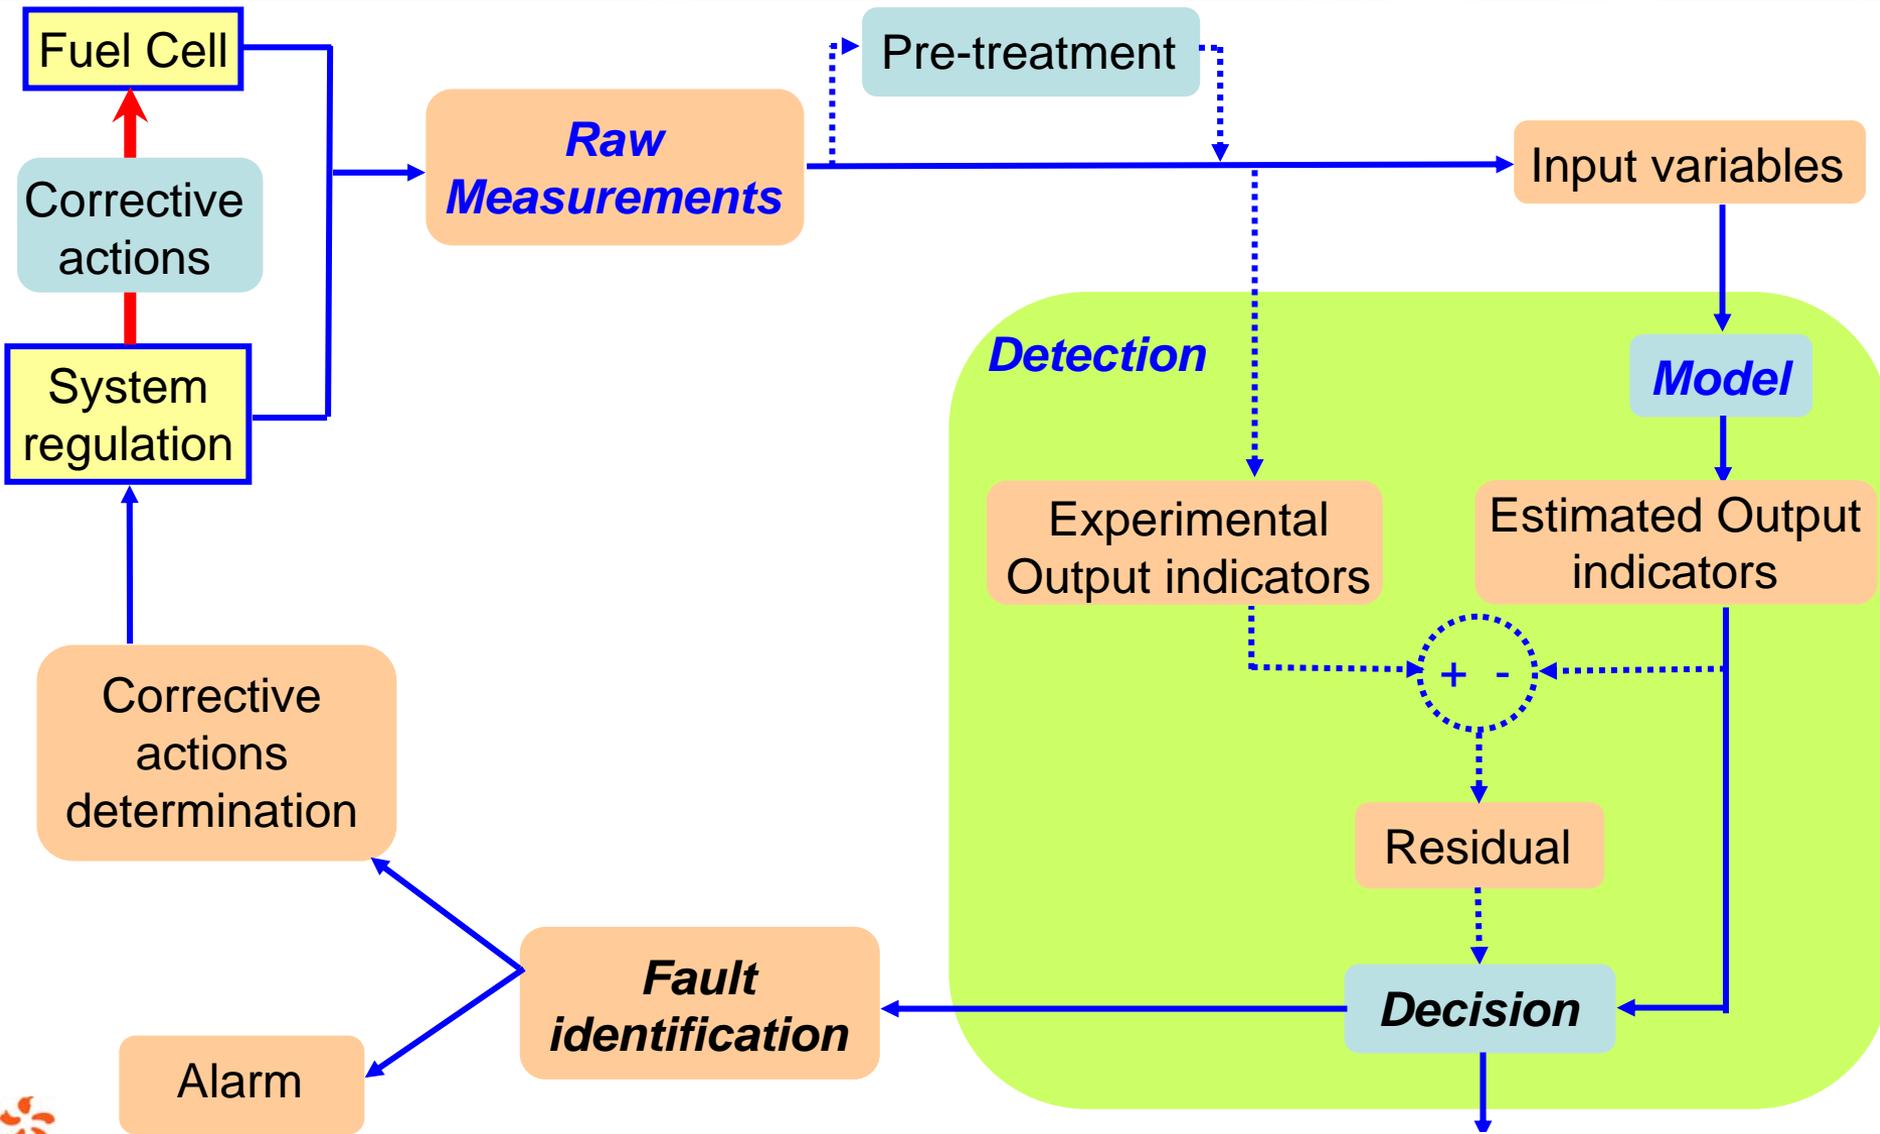

Outline

- Introduction
- Developed measurements
- Stacks characterization
- Developed model
- Conclusions and future work

Scope of the study

- Fuel cell insufficiently mature, partly due to limited lifetime
 - ⇒ Need for diagnosis tools to detect and classify failures or faulty operation modes so as to prevent or limit degradation.
 - Important causes of degradations / failures:
 - Bad water management (flooding, drying): usually reversible and quite easy to control.
 - Poisoning: reversibility = $f(\text{pollutant nature, concentration})$, hardly controllable for air pollution, more easily for fuel pollutant like CO.
 - Carbon corrosion, catalyst oxidation; usually irreversible and impossible to control, particularly at stack level.
- ⇒ focus on water management and CO poisoning issues.

Basics on diagnostic

OK

Outline

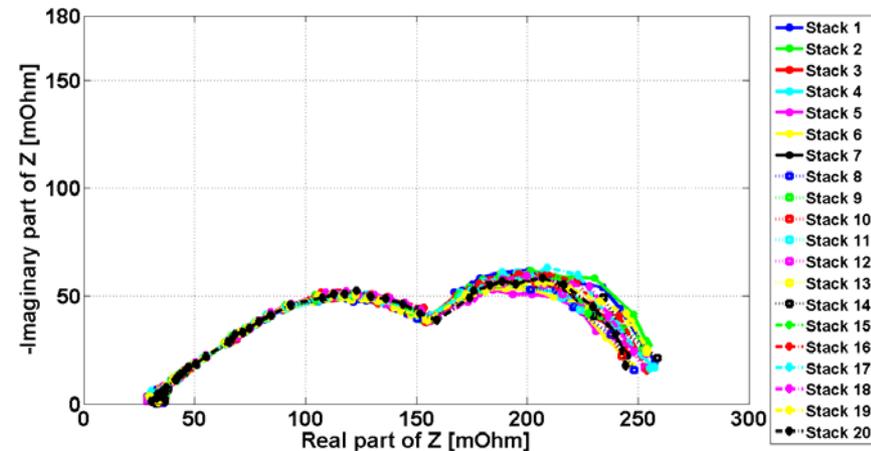

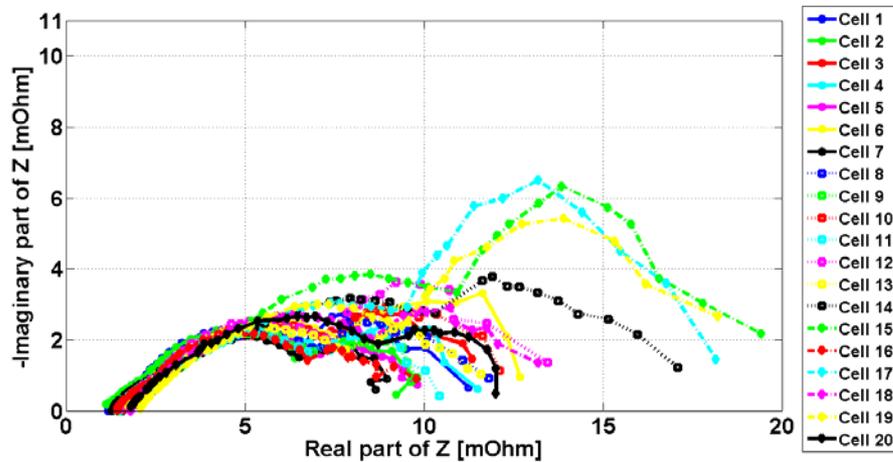

- Introduction
- **Developpement of new measurement tools**
 - **New high power impedancemeter.**
 - **Integrated acquisition cardboard.**
- Stacks characterization
- Developped algorithm
- Conclusions and future work

- Previous systems' limitations:

Many impedancemeters of the public market are limited to a few Volts with regard to the measurement voltage.

⇒ Development of a new EIS system:

- High resolution digital analogic converter (26 bits).
- 32 acquisition channels (1 for I + 31 for U up to 300V).
- Allows 2 simultaneous measurements (stack + individual cells or groups of cells).

→ Large dispersion in cell impedance spectra due to

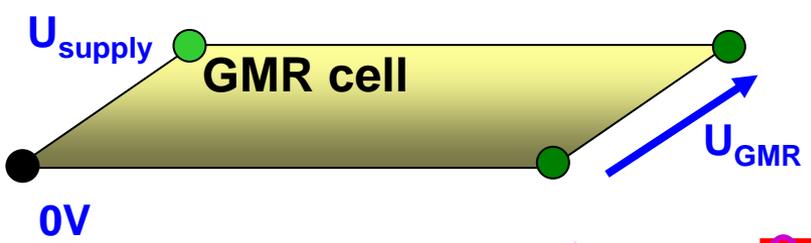

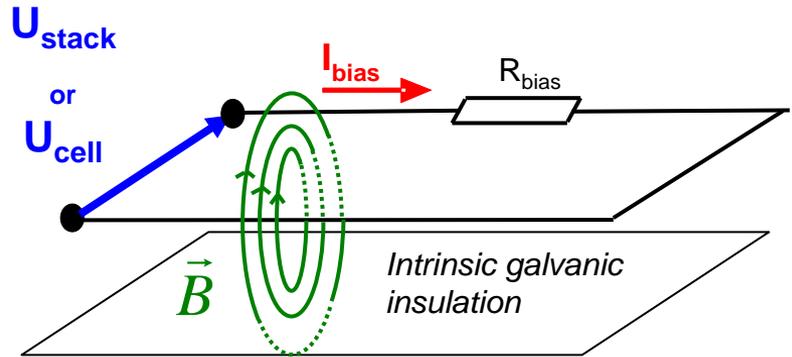

- cell position in the stack,
- cell state of health.

→ Stack impedance spectra are close and do not depend on time

Acquisition cardboard

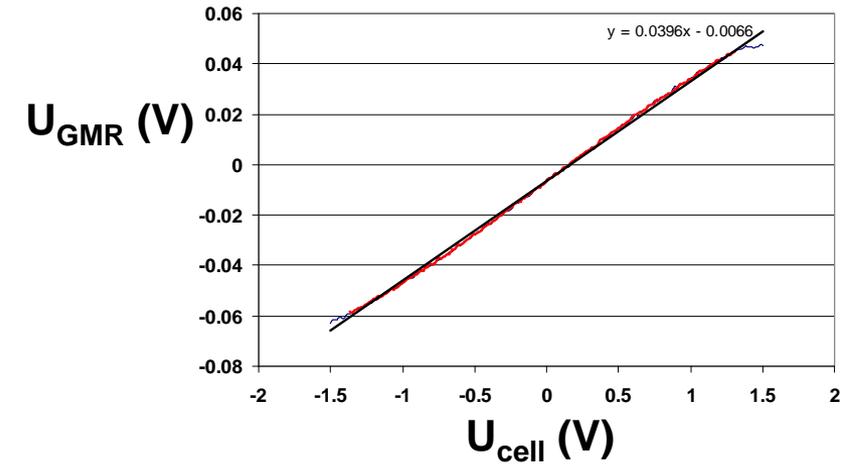

- Basic principle:

Generation of a bias current:

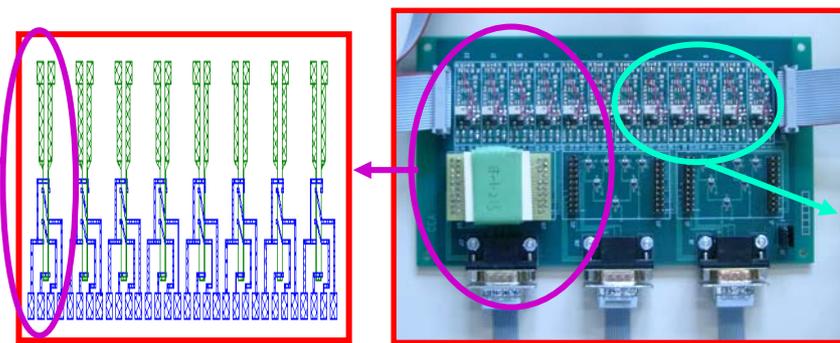

Measurement of U_{GMR} similar with Wheatstone bridge principle

- GMR Performances:

Error < 1% (can be reduced but with sensitivity loss)

- Integration:

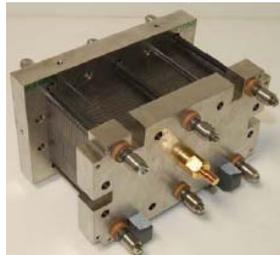

Amplifier & multiplexer

Outline

- Introduction
- Developpement of new measurement tools
- **Stacks characterization**
- Developped algorithm
- Conclusions and future work

Experimentals

- 3 stacks technologies:

3M

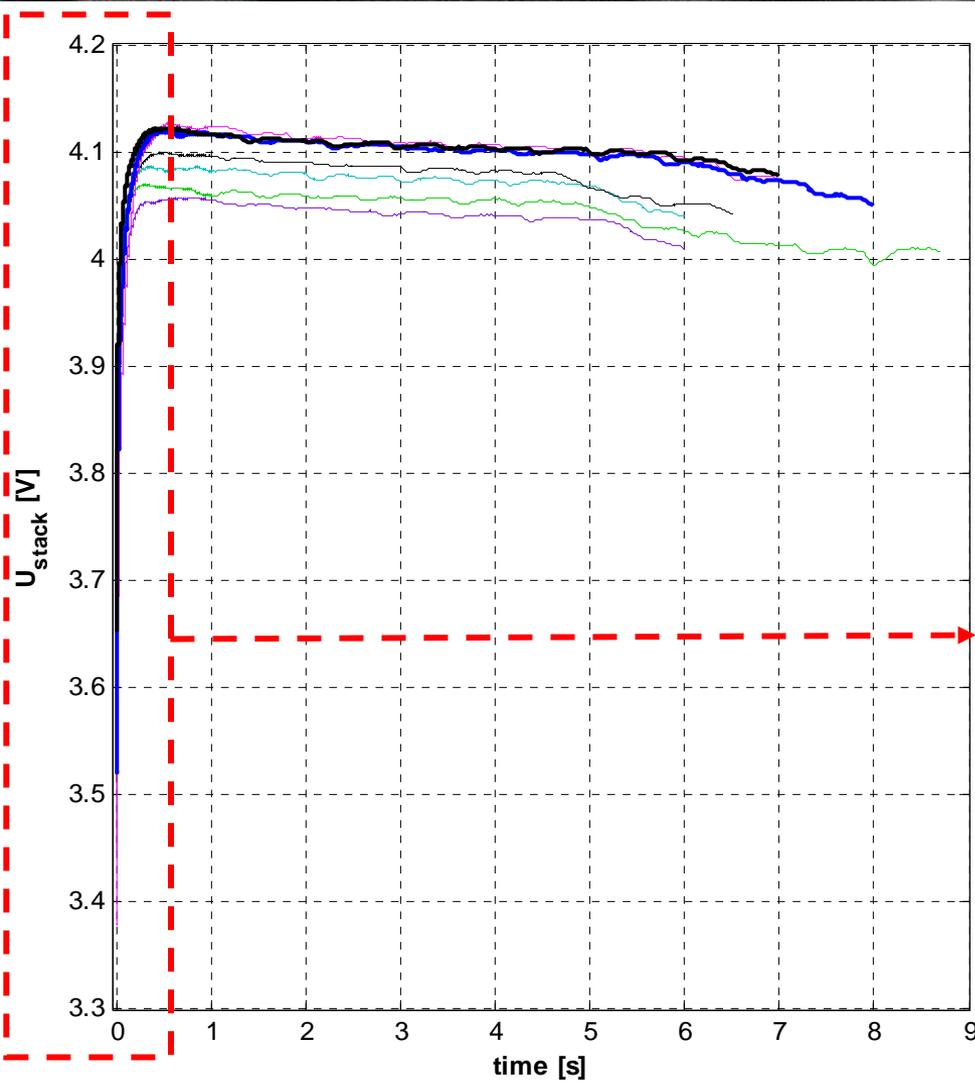

- Design of experiment methodology:

- 6 parameters: anodic and cathodic overstoichiometric ratios, fuel and oxident relative humidities, fuel CO content, stack temperature.
- 2^{6-2} (16 experiments) design of experiments, with aliases.

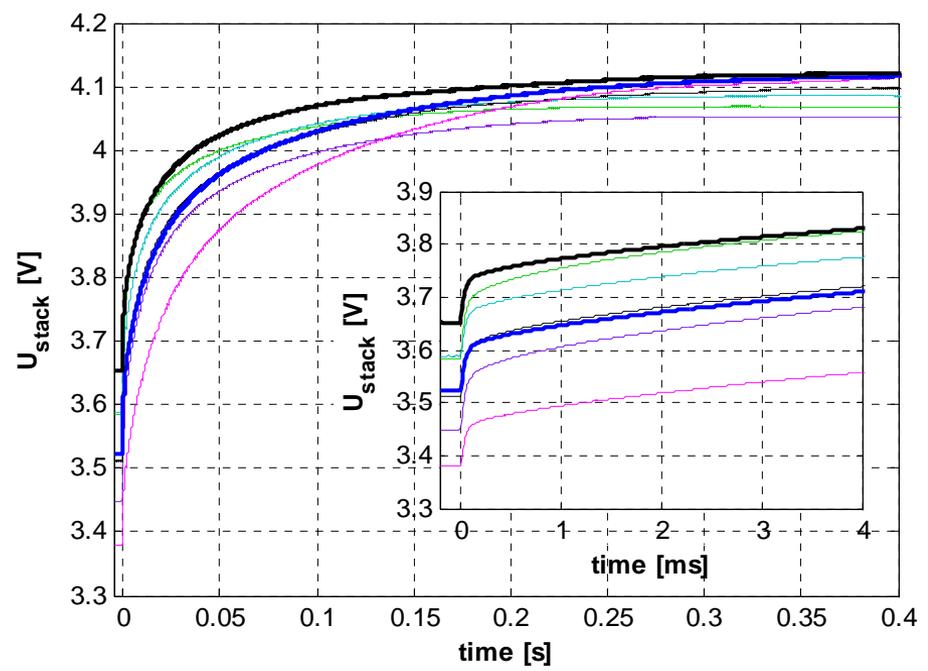

- Characterisations:

- Current steps profile:
 - ✓ Current + Individual and total stack voltages: 100 kHz during 5 to 10s.
 - ✓ Process regulation parameters + pressure drops: 1 Hz.
- EIS.

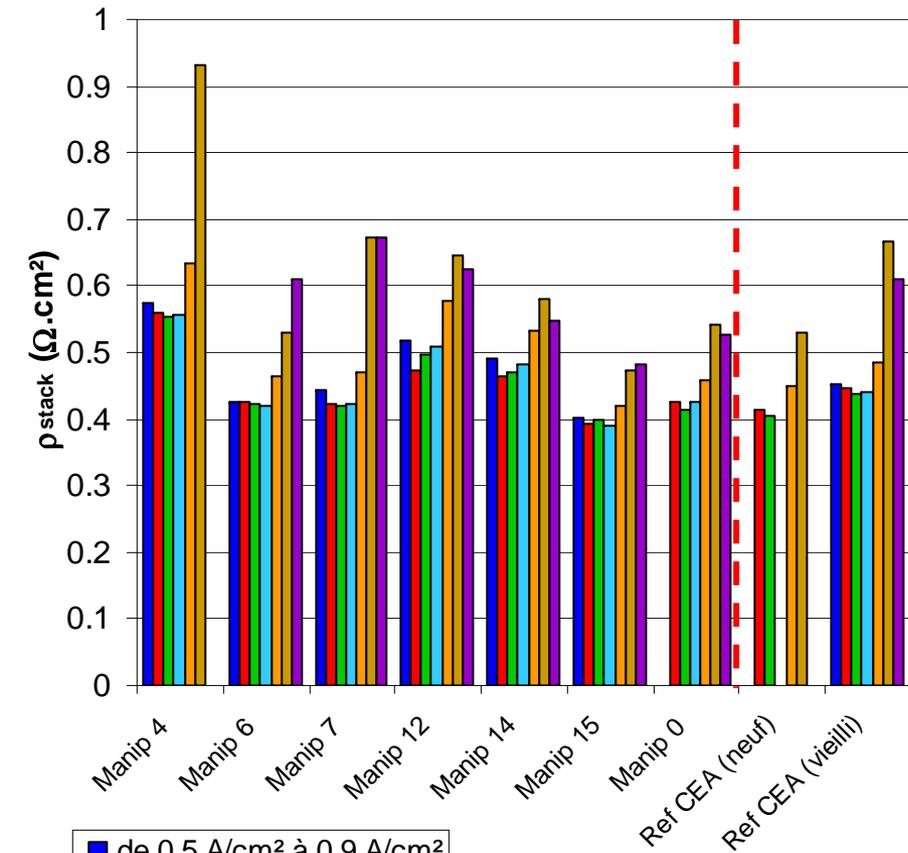

Transient behavior of CEA 5 cells stack during current step from 0.4 A/cm² to 0.2 A/cm²

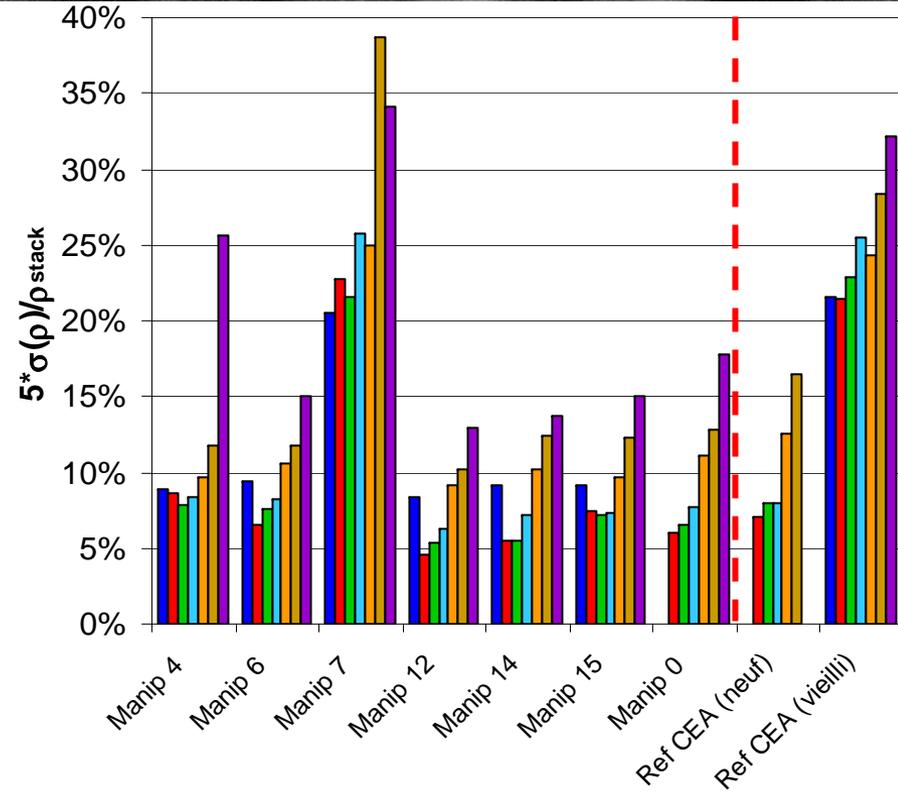

- $h_a = h_c = 35\%$, $s_a = 2.5$, $s_c = 3$, $T = 80^\circ\text{C}$
- $h_a = 35\%$, $h_c = 75\%$, $s_a = 1.5$, $s_c = 3$, $T = 80^\circ\text{C}$
- $h_a = 75\%$, $h_c = 35\%$, $s_a = 2.5$, $s_c = 3$, $T = 50^\circ\text{C}$
- $h_a = h_c = 75\%$, $s_a = 1.5$, $s_c = 3$, $T = 50^\circ\text{C}$
- $h_a = h_c = 75\%$, $s_a = 2.5$, $s_c = 1.5$, $T = 80^\circ\text{C}$
- $h_a = h_c = 50\%$, $s_a = 2$, $s_c = 2.25$, $T = 65^\circ\text{C}$
- $h_a = h_c = 50\%$, $s_a = s_c = 2$, $T = 80^\circ\text{C}$

5 cells stack resistivity and individual cell resistivity scattering

- de 0.5 A/cm² à 0.9 A/cm²
- de 0.9 A/cm² à 0.7 A/cm²
- de 0.7 A/cm² à 0.6 A/cm²
- de 0.6 A/cm² à 0.4 A/cm²
- de 0.4 A/cm² à 0.2 A/cm²
- de 0.2 A/cm² à 0.1 A/cm²
- de 0 à 0.5 A/cm²

| Ref CEA | $h_a = h_c = 50\%$, $s_a = s_c = 2$, $T = 80^\circ C$ |

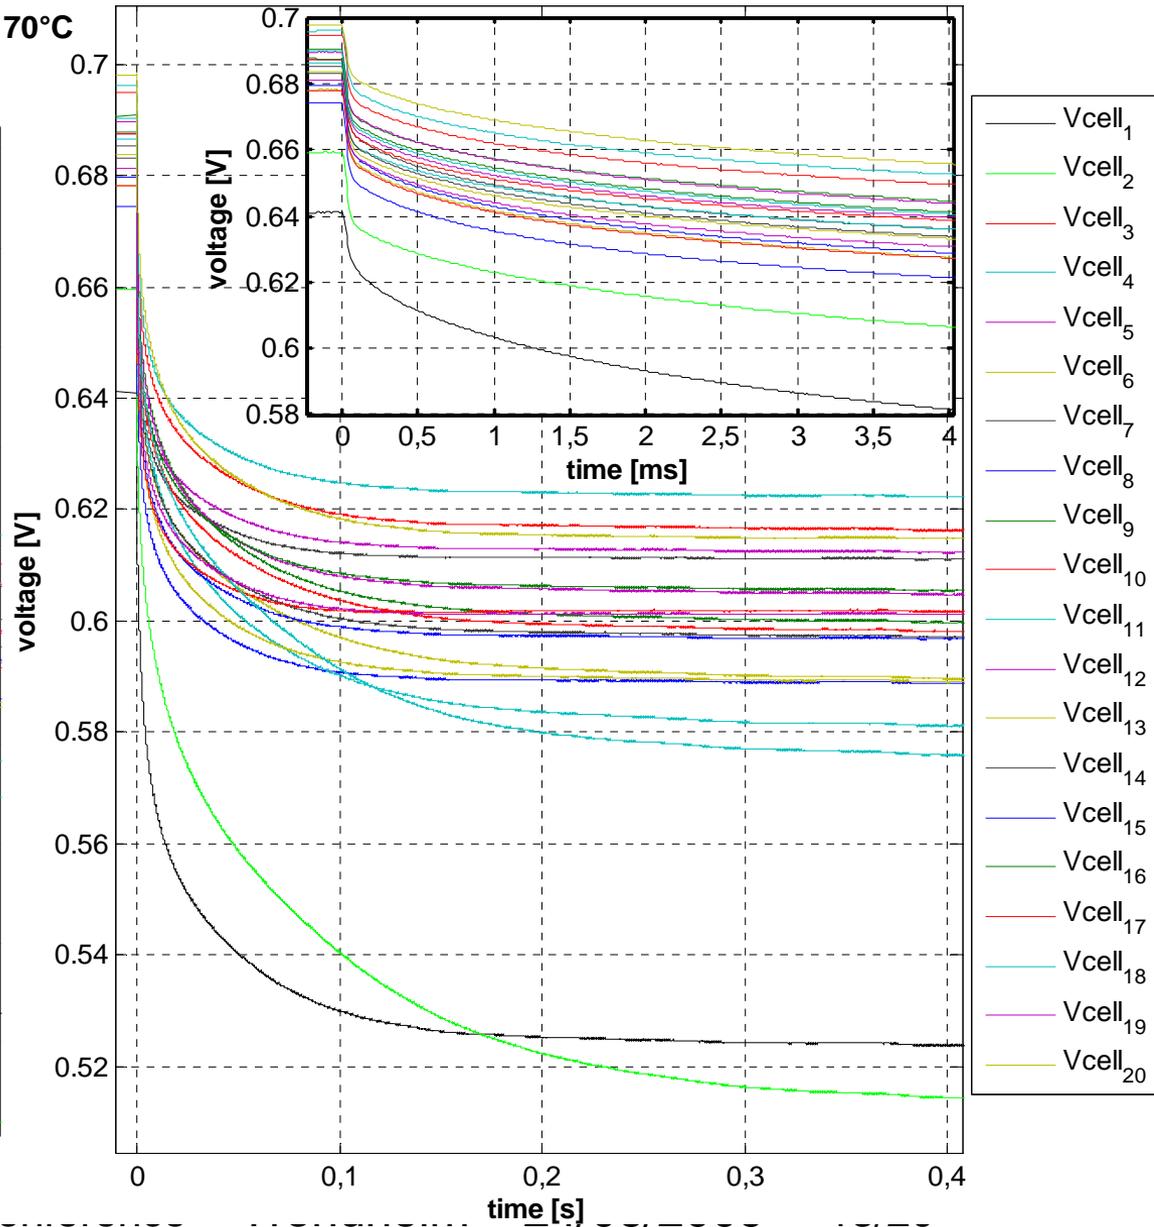

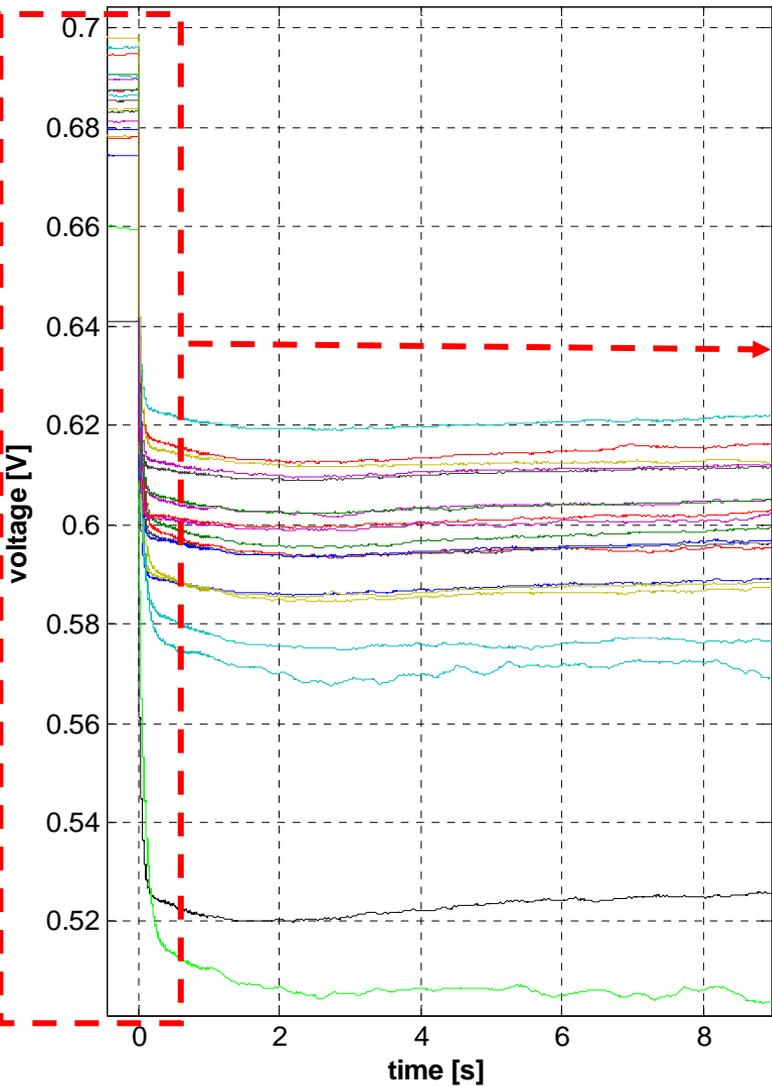

Transient behavior of 3M 20 cells stack during a current step from 0.5 A/cm² to 0.7 A/cm²

$h_a = 50\%$; $h_c = 50\%$; $s_a = 2.4$; $s_c = 2.5$; $T = 70^\circ\text{C}$

current step: 0,5 to 0,7 A.cm⁻²

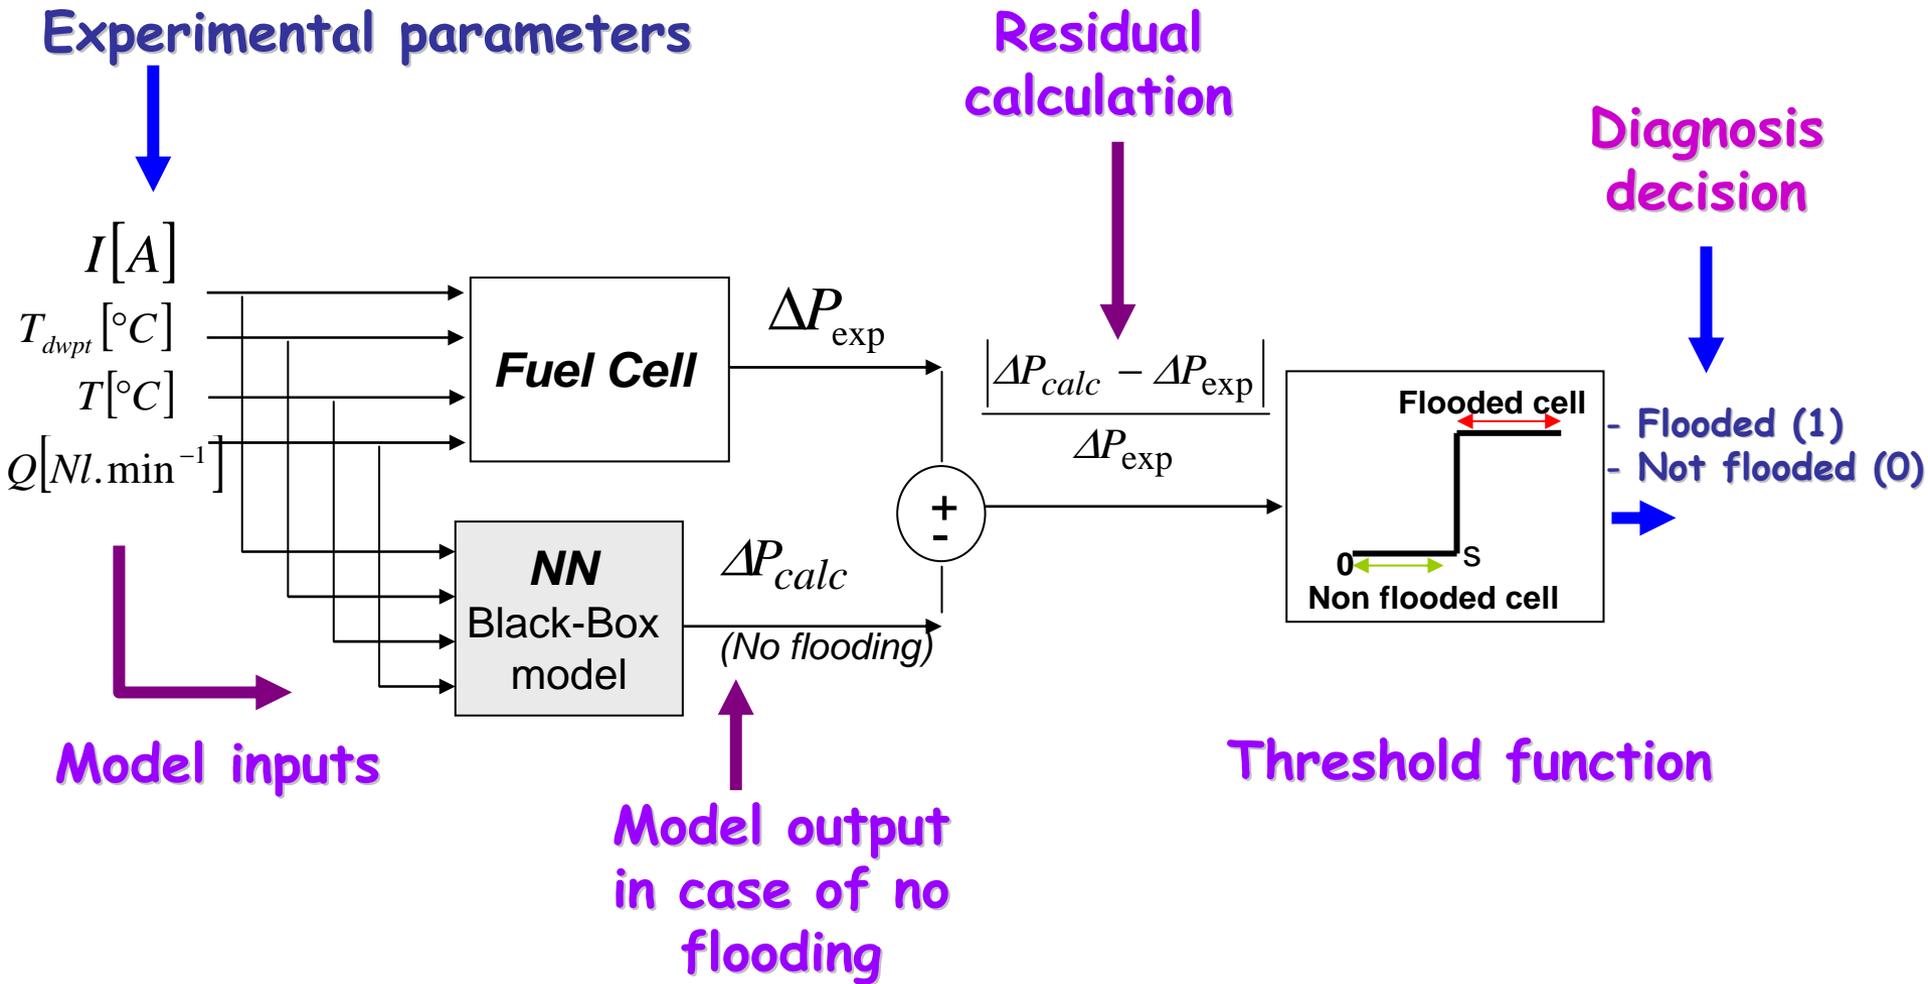

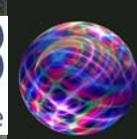

Outline

- Introduction
- Development of new measurement tools
- Stacks characterization
- **Developped algorithms:**
 - Physical model based.
 - Black box model based.
- Conclusions and future work

- Input variables:
 - H_2O , H_2 , O_2 and CO partial pressures, H^+ concentration.
 - fraction of catalytic sites poisoned by CO .
 - water content in membrane and GDLs.
- 1D (\perp to MEA plane) model taking into account:
 - kinetics of electrochemical reactions.
 - diffusion-migration (mass conservation equation).
 - water balance in each compartment : GC, GDL, membrane,...(cf. Benziger et al.)
- Model simplification by :
 - discretization for approximation of conservation equations (via orthogonal collocation method).
 - Analysis of the different time-scales phenomena (in adsorption/desorption, water diffusion)

\Rightarrow Reduced OD model describing I-U relation in various operating conditions.
- Serie-parallel "assembly" of the model to simulate a cell heterogeneity and a stack.
- Output: polarization and EIS curves, are determined analytically

Flooding diagnosis algorithm

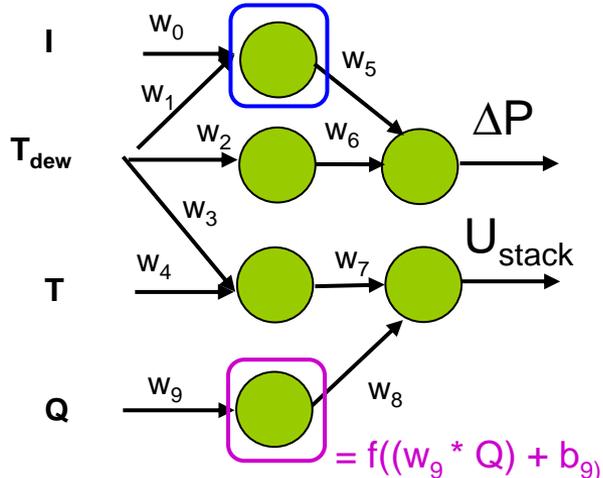

Neural network ?...

• Definitions:

- **Neuron** = succession of 2 mathematical functions: multiparameter linear combination + other (e.g. identity, sigmoid, linear,...)
- **Layer** = group of unconnected neurons.

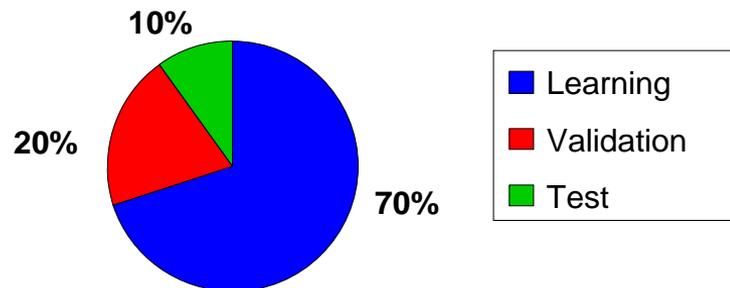

$$= f((w_0 * I) + (w_1 * T_{dew}) + b_0 + b_1)$$

$w_i \Leftrightarrow$ coefficients of multiparameter linear combination function

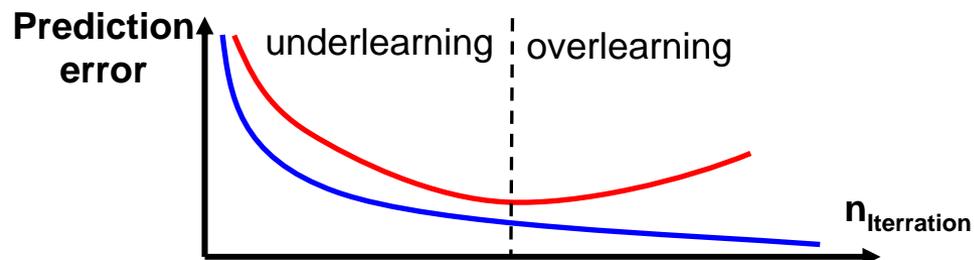

• How is it build (3 steps) ?

- **Architecture definition:**
 - ✓ Inputs = experimental parameters.
 - ✓ Number of layers ≥ 2 .
 - ✓ Number of neuron/layer \Leftrightarrow compromise risks of overlearning and underlearning.
- **Database random splitting:**

➤ Learning + Validation:

- ✓ determination of w_i and b_i by iterative interpolation.
- ✓ optimization of iteration number on learning:

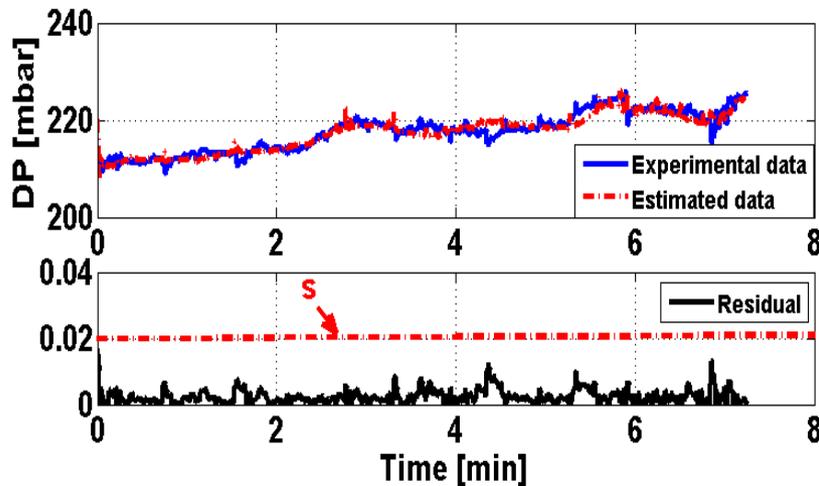

➤ **Test** \Leftrightarrow the network ability to predict the output

Results: Neural network build-up

Database:

| | |
|----------------------------|---------------|
| T [$^{\circ}C$] | $\in [35-40]$ |
| T_{dwpt} [$^{\circ}C$] | $\in [25-50]$ |
| I [A] | $\in [0-35]$ |
| Q [$Nl.min^{-1}$] | $\in [30-55]$ |

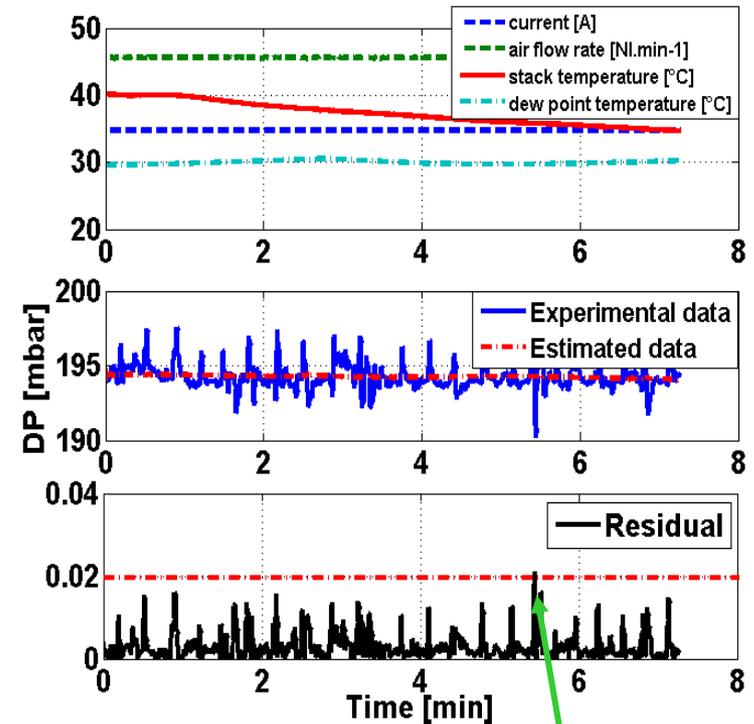

Learning on $DP = f(t)$:

Threshold definition:
 $s = 3 * |\sigma(\text{residual})|$

Test:

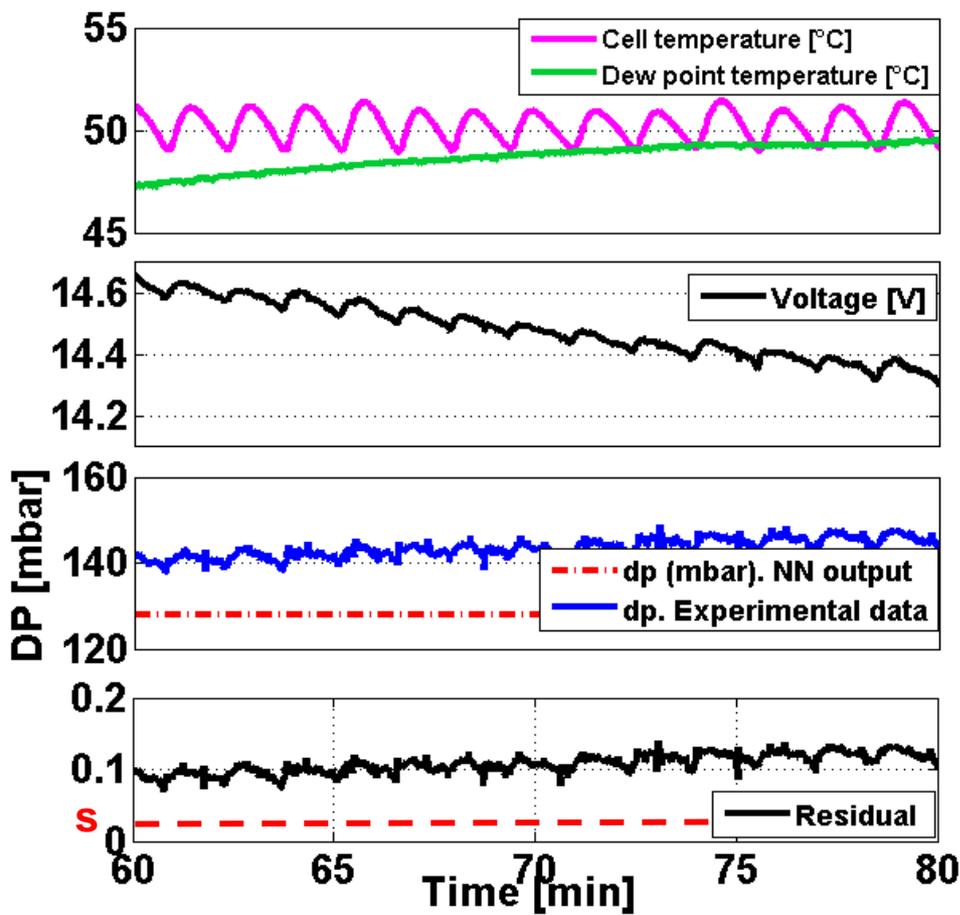

Not flooded cell, data not previously seen by the Neural Network

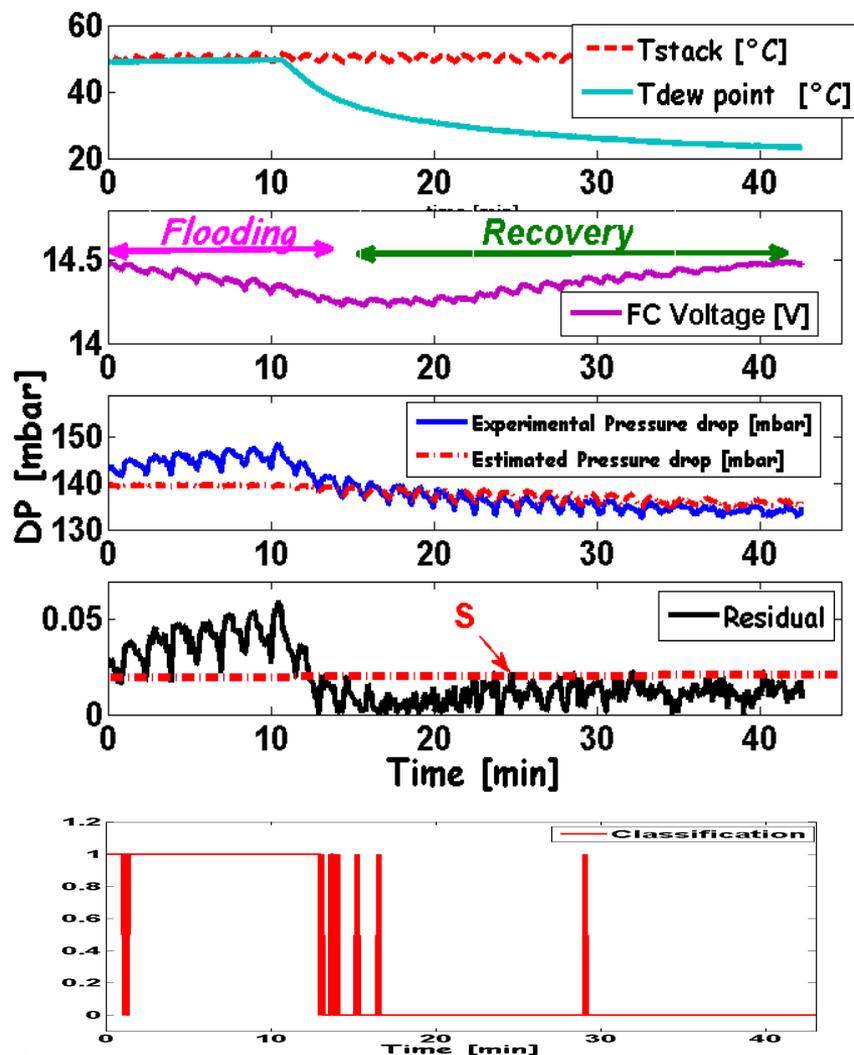

One punctual wrong alarm

Results: Model application to flooding diagnosis

Flooding detection:

Detection of flooding and recovery:

Conclusions & next steps

- Main achievements:

- Developments of:

- ✓ A diagnosis model for water management issues.
- ✓ A new EIS system for operation at high stack voltages (up to 300 V).
- ✓ A hardware for acquisition, treatment and storage of system data during operation.

- Next steps:

- Design of experiment analysis on different 20 cells stacks by EIS and current steps (*in progress*).
- Extend diagnosis model to CO poisoning detection (*in progress*).
- Generalize the diagnosis model to different PEMFC stack technologies (*in progress*).
- Interface the diagnosis model with the hardware in a diagnosis tool to be validated on a 20 cells stack.
- Export the methodology to develop a tool for other fuel cells technologies: FCH-JU JTI CP 2008 "GENIUS" project for SOFCs.
